# BOUNDEDNESS AND COMPACTNESS OF GENERAL KERNEL INTEGRAL OPERATORS FROM A WEIGHTED BANACH FUNCTION SPACE INTO $\mathbf{L}_{\infty}$ 

JAN LANG, ALEŠ NEKVINDA, AND LUBOŠ PICK

#### Abstract

We give necessary and sufficient conditions for boundedness and compactness of a general kernel integral operator $L f(x)=\int_{I} \ell(x, t) f(t) \mathrm{d} t$, where the kernel $\ell$ is assumed only to be measurable, from an arbitrary weighted Banach function space into $L_{\infty}$. We give lower and upper bounds for the distance of $L$ from compact operators. The proofs are carried out by means of a new method based on real-variable techniques.

## 1. Introbuction

The problem of boundedness and compactness of kernel integral operators $L f(x)=\int_{I} \ell(x, t) f(t) \mathrm{d} t$, where $\ell(x, t)$ is a general measurable function on $I^{2}$ and $I$ is an interval, and their distance from compact operators, have been studied by many authors (cf. e.g. [7], [3], [9], [8], or the monograph [2]). Usually, for $L_{p}-L_{q}$ type estimates with $q<\infty$, the authors use rather restrictive assumptions on the kernels. Typically (see for example [[8], (1.3)]), the kernel is supposed to be positive, monotone in each variable, locally uniformly continuous, and satisfying certain triangle inequality.

The situation turns out to be different when the target space is $L_{\infty}$. For example, in [5], boundedness and compactness of the Hardy operator $H f(x)=\int_{0}^{x} f(t) d t$ from a weighted Banach function space $(X, v)$ into $L_{\infty}$ was characterized by relatively simple conditions. The methods from [5] can be immediately generalized to kernel operators $T f(x)=\int_{0}^{\infty} k(x, t) f(t) \mathrm{d} t$, but only when $k$ is positive and monotone in the first variable.

In this paper we develop a different method based on real-variable methods and measure-theoretic considerations, which enables us to characterize completely boundedness and compactness of the kernel operator, assuming only that the kernel is measurable. A remarkable fact is that $\ell$ is allowed to take negative values. We further give sharp lower and upper bounds for the distance of $L$ from the set of compact linear operators. Notably, it turns out that every compact operator can be approximated by operators with kernels of the form $k(x, t)=\sum_{i=1}^{n} \chi_{M_{i}}(x) \psi_{i}(t)$, where $M_{i} \subset I$ and $\frac{\psi_{i}}{v} \in\left(X^{\prime}, v\right)$ (here $\left(X^{\prime}, v\right)$ denotes the associate space to $(X, v)$ ).

In the particular case when $(X, v)$ is separable, some of the results were obtained in [4].

[^0]The paper is structured as follows: preliminary material and some basic facts on Banach function spaces are collected in Section 2 (the standard general reference is [6] or [1]). In Section 3 we characterize boundedness of $L$ by means of the norm of $\ell$ in $L_{\infty}\left(X^{\prime}, v\right)$. This section also contains the key real-variable considerations. In Section 4 we characterize compactness of $L$, and in Section 5 we present lower and upper bounds for the distance of the Hardy operator from compact operators, recovering thereby, in particular, a result from [5].

## 2. Preliminaries

Let $-\infty \leq a<b \leq \infty$ and let $I=(a, b)$. Let $\mathfrak{M}(I)$ and $\mathfrak{M}\left(I^{2}\right)$ denote the sets of all measurable functions on $I$ and $I^{2}$. Let $v$ be a weight (that is, a measurable and a.e. positive and measurable function) on $I$.

Definition 2.1. We say that a normed linear subspace $(X, v)$ of $\mathfrak{M}(I)$ is a weighted Banach function space if the following five axioms are satisfied:
(2.1) the norm $\|f\|_{X, v}$ is defined for all $f \in \mathfrak{M}(I)$, and $f \in(X, v)$ if and only if $\|f\|_{X, v}<\infty$
(2.2) $\|f\|_{X, v}=\||f|\|_{X, v}$ for all $f \in \mathfrak{M}(I)$;
(2.3) $0 \leq f_{n} \nearrow f$ a.e. in $I$, then $\left\|f_{n}\right\|_{X, v} \nearrow\|f\|_{X, v}$;
(2.4) if $v(E)=\int_{E} v(t) d t<\infty$, then $\chi_{E} \in(X, v)$, where $\chi_{E}$ denotes the characteristic function of $E$;
(2.5) for every $E$ with $v(E)<\infty$ there exists a constant $C_{E}$ such that

$$
\int_{E} f(t) v(t) d t \leq C_{E}\|f\|_{X, v} \text { for all } f \in(X, v)(I) .
$$

In what follows, $(X, v)$ will be a fixed weighted Banach function space.
Definition 2.2. The set

$$
\left(X^{\prime}, v\right)=\left\{f ; \int_{I}|f(t) g(t)| v(t) d t<\infty \quad \text { for all } \quad g \in(X, v)\right\}
$$

is called the associate space of $(X, v)$. The space $\left(X^{\prime}, v\right)$, equipped with the norm

$$
\|f\|_{X^{\prime}, v}:=\sup _{\|g\|_{X, v} \leq 1}\left|\int_{I} f(t) g(t) v(t) d t\right|
$$

is also a weighted Banach function space. The Hölder inequality

$$
\begin{equation*}
\int_{I}|f g| v \leq\|f\|_{X, v}\|g\|_{X^{\prime}, v} \tag{2.6}
\end{equation*}
$$

holds, and it is saturated in the sense that for every $g \in \mathfrak{M}(I)$ and $\varepsilon>0$ there exists a function, $f$, such that $\|f\|_{X, v}=1$ and

$$
\begin{equation*}
(1-\varepsilon)\|g\|_{X^{\prime}, v} \leq \int_{I} f g v \tag{2.7}
\end{equation*}
$$

Throughout the paper we shall work with a kernel operator $L$, defined for $f \in$ $(X, v)$ by

$$
L f(x)=\int_{I} \ell(x, t) f(t) d t
$$

where $\ell$ is a kernel, that is, $\ell \in \mathfrak{M}\left(I^{2}\right)$.
Of course, $\int_{I} \ell(x, t) f(t) d t$ need not have a sense for some functions from $(X, v)$. We say that the kernel $\ell$ is admissible, $\ell \in \mathcal{A}$, if there is a set $J \subset I,|I \backslash J|=0$ (where $|E|$ denotes the Lebesgue measure of $E$ ), such that for every $f \in(X, v)$ the function $x \mapsto \int_{I} \ell(x, t) f(t) d t$ is defined everywhere in $J$.

Lemma 2.3. $\ell \in \mathcal{A}$ if and only if $\frac{\ell(x, .)}{v(.)} \in\left(X^{\prime}, v\right)$ for each $x \in J$.
Proof. Let $x \in J$ and $\frac{\ell(x, .)}{v(.)} \in\left(X^{\prime}, v\right)$. By Hölder's inequality we have for $f \in\left(X^{\prime}, v\right)$

$$
\int_{I}|\ell(x, t) f(t)| d t \leq\left\|\frac{\ell(x, .)}{v(.)}\right\|_{\left(X^{\prime}, v\right)}\|f\|_{(X, v)}<\infty
$$

Thus, $\int_{I} \ell(x, t) f(t) d t$ has a sence and $\ell \in \mathcal{A}$.
Let $\ell \in \mathcal{A}, x \in J$. Assume $\frac{\ell(x, .)}{v(.)} \notin\left(X^{\prime}, v\right)$.
I. Suppose first $\ell(x, t) \geq 0$ and set $I^{+}=\{t \in I ; \ell(x, t)>0\}$. Since $\sup \left\{\int_{I}|\ell(x, t) f(t)| d t ;\|f\|_{(X, v)} \leq 1\right\}=\infty$ there exists a sequence $0 \leq f_{n}$, $\left\|f_{n}\right\|_{(X, v)} \leq 1$ and $\int_{I} \ell(x, t) f(t) d t \geq n^{3}$. Setting $f_{0}(t)=\chi_{I^{+}}(t) \sum_{n=1}^{\infty} n^{-2} f_{n}(t)$ we easily obtain $f_{0}(t) \geq 0, f_{0}(t)=0$ for $t \in I \backslash I^{+}, f_{0}(t) \in(X, v)$ and

$$
\begin{equation*}
\int_{I} \ell(x, t) f_{0}(t) d t=\infty \tag{2.8}
\end{equation*}
$$

Set $I_{k}=\left[2^{k}, 2^{k+1}\right)$ and $A_{k}=f_{0}^{-1}\left(I_{k}\right)$ for each $k \in \mathbb{Z}$. Thus, $I^{+}=\bigcup_{k \in \mathbb{Z}} A_{k}$ and

$$
\sum_{k=-\infty}^{\infty} 2^{k} \int_{A_{k}} \ell(x, t) d t \leq \int_{I^{+}} \ell(x, t) f_{0}(t) d t \leq 2 \sum_{k=-\infty}^{\infty} 2^{k} \int_{A_{k}} \ell(x, t) d t
$$

which yields with (2.8)

$$
\sum_{k=-\infty}^{\infty} 2^{k} \int_{A_{k}} \ell(x, t) d t=\infty
$$

Let $\mathbb{Z}_{1}, \mathbb{Z}_{2}$ be disjoint subsets of $\mathbb{Z}$ with $\mathbb{Z}_{1} \cup \mathbb{Z}_{2}=\mathbb{Z}$ and $\sum_{k \in \mathbb{Z}_{1}} 2^{k} \int_{A_{k}} \ell(x, t) d t=$ $\infty$ and $\sum_{k=\mathbb{Z}_{2}} 2^{k} \int_{A_{k}} \ell(x, t) d t=\infty$. Set $f_{1}(t)=\sum_{k \in \mathbb{Z}_{1}} f_{0}(t) \chi_{A_{k}}(t), f_{1}(t)=$ $\sum_{k \in \mathbb{Z}_{2}} f_{0}(t) \chi_{A_{k}}(t)$ and $g=f_{1}-f_{2}$. Then $g \in(X, v)$ and $\int_{I} \ell(x, t) g(t) d t=$ $\int_{I} \ell(x, t) f_{1}(t) d t-\int_{I} \ell(x, t) f_{2}(t) d t$ has no sense which is a contradiction with $\ell \in \mathcal{A}$.
II. Let $\ell(x,.) \in \mathfrak{M}(I)$ then we can write $\ell=\ell^{+}-\ell^{-}$and either $\frac{\ell^{+}(x .)}{v(.)} \notin\left(X^{\prime}, v\right)$ or $\frac{\ell^{-}(x, .)}{v(.)} \notin\left(X^{\prime}, v\right)$. Without loss of generality assume $\frac{\left.\ell^{+}(x .)\right)}{v(.)} \notin\left(X^{\prime}, v\right)$. Take $g \in(X, v)$ as bellow such that $\{t \in I ; g(t)>0\} \subset\left\{t \in I ; \ell^{+}(x, t)>0\right\}$ and $\int_{I} \ell^{+}(x, t) g(t)$ has no sense. Then also $\int_{I} \ell(x, t) g(t)=\int_{I} \ell^{+}(x, t) g(t)$ has no sense which contradicts to $\ell \in \mathcal{A}$.

Let us recall that $f \in L_{\infty}$ if $f \in \mathfrak{M}(I)$ and

$$
\|f\|_{L_{\infty}}=\underset{x \in I}{\operatorname{ess} \sup }|f(x)|=\inf _{|M|=0} \sup _{x \in(I \backslash M)}|f(x)|<\infty .
$$

By $\|L\|$ we denote the operator norm of $L$ from $(X, v)$ into $L_{\infty}$, i.e.,

$$
\begin{equation*}
\|L\|=\sup _{\|f\|_{X, v} \leq 1} \operatorname{ess} \sup _{x \in I}\left|\int_{I} \ell(x, t) f(t) d t\right| . \tag{2.9}
\end{equation*}
$$

## 3. Boundedness of a general kernel operator

Our goal in this section is to establish
Theorem 3.1. Let $I$ be an arbitrary interval, $(X, v)$ a Banach function space, and $\ell \in \mathcal{A}$. Then the function $x \mapsto\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}$ is measurable. Moreover, setting

$$
\begin{equation*}
\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}=\underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v} \tag{3.1}
\end{equation*}
$$

we have $\|L\|=\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$.
Let us start with the proof of the inequality $\|L\| \geq\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$. Basically, we have to interchange the supremum and the essential supremum in the definition of $\|L\|$ (cf. (2.9)). We start with two measure-theoretic lemmas.

For $A \subset I^{2}$, we denote by $A_{x}$ the intersection of $A$ with $\{x\} \times I$, i.e., $A_{x}=$ $\{y ;(x, y) \in A\}$. As usual, $A \div B$ denotes the symmetric difference of $A$ and $B$.
Convention. In the rest of this section we assume that $(X, v)$ is a fixed weighted Banach function space. We also, without any loss of generality, will assume that $I=[0,1]$.

Lemma 3.2. Let $\Omega \subset I^{2}$ be an open set. Let $M \subset I$ be a measurable set such that $|(x-\delta, x+\delta) \cap M|>0$ for all $x \in M$ and $\delta>0$. Then for every $\varepsilon>0$ there exist a $Z \subset I$ and an $N \subset M$ such that $|N|>0$ and $\left|\Omega_{x} \div Z\right|<\varepsilon$ for every $x \in N$.

Proof. Assume the contrary. Let $\varepsilon>0$ be such that for every $Z \subset I$ and $N \subset M$, $|N|>0$, there is an $x \in N$ such that $\left|\Omega_{x} \div Z\right|>\varepsilon$. Let $x_{0} \in M$. Then $\Omega_{x_{0}}$ is an open subset of $I$, whence either $\Omega_{x_{0}}=\emptyset$ or $\Omega_{x_{0}}=\bigcup_{i=1}^{\infty}\left(a_{i}, b_{i}\right)$ for some $0 \leq a_{i}<b_{i} \leq 1$. By the regularity of measure, there is a $K_{0}=\bigcup_{i=1}^{n_{0}}\left[c_{i}, d_{i}\right]$ such that $K_{0} \subset \Omega_{x_{0}}$ and

$$
\begin{equation*}
\left|\Omega_{x_{0}} \backslash K_{0}\right|<\frac{\varepsilon}{4} . \tag{3.2}
\end{equation*}
$$

Now, $K_{0}$ is compact. Therefore, the distance of $\left\{x_{0}\right\} \times K_{0}$ from $I^{2} \backslash \Omega$ is positive. Thus, for a $\delta_{0}>0$ small enough we have

$$
\begin{equation*}
\left(x_{0}-\delta_{0}, x_{0}+\delta_{0}\right) \times K_{0} \subset \Omega \tag{3.3}
\end{equation*}
$$

Set $Z=\Omega_{x_{0}}$ and $N=\left(x_{0}-\delta_{0}, x_{0}+\delta_{0}\right) \cap M$. By our assumption, there is an $x_{1} \in\left(x_{0}-\delta_{0}, x_{0}+\delta_{0}\right) \cap M$ such that

$$
\begin{equation*}
\left|\Omega_{x_{0}} \div \Omega_{x_{1}}\right|>\varepsilon . \tag{3.4}
\end{equation*}
$$

Now, by (3.3), $K_{0} \subset \Omega_{x_{1}}$, (3.2), and (3.4),

$$
\begin{equation*}
\left|\Omega_{x_{1}} \backslash K_{0}\right|>\frac{3 \varepsilon}{4} \tag{3.5}
\end{equation*}
$$

Since $\Omega_{x_{1}} \backslash K_{0}$ is open, there exists a set $R_{1}=\bigcup_{i=n_{0}+1}^{n_{1}}\left[c_{i}, d_{i}\right] \subset\left(\Omega_{x_{1}} \backslash K_{0}\right)$ such that

$$
\begin{equation*}
\left|\Omega_{x_{1}} \backslash\left(R_{1} \cup K_{0}\right)\right|<\frac{\varepsilon}{4}, \tag{3.6}
\end{equation*}
$$

and as a consequence of (3.5) and (3.6) we have

$$
\left|R_{1}\right|>\frac{\varepsilon}{2}
$$

Denote $K_{1}=R_{1} \cup K_{0}=\bigcup_{i=1}^{n_{1}}\left[c_{i}, d_{i}\right]$. Now, as above, $K_{1}$ is compact, whence, for $\delta_{1}>0$ small enough, we have

$$
\left(x_{1}-\delta_{1}, x_{1}+\delta_{1}\right) \times K_{1} \subset \Omega .
$$

Let $Z=\Omega_{x_{1}}$ and $N=\left(x_{1}-\delta_{1}, x_{1}+\delta_{1}\right) \cap M$. By our assumption, there is an $x_{2} \in\left(x_{1}-\delta_{1}, x_{1}+\delta_{1}\right) \cap M$ such that $\left|\Omega_{x_{1}} \div \Omega_{x_{2}}\right|>\varepsilon$. As above, $K_{1} \subset \Omega$ and $\left|\Omega_{x_{2}} \backslash K_{1}\right|>\frac{3 \varepsilon}{4}$. Since $\Omega_{x_{2}} \backslash K_{1}$ is an open set, there is a set $R_{2}=\bigcup_{i=n_{1}+1}^{n_{2}}\left[c_{i}, d_{i}\right] \subset$ $\left(\Omega_{x_{2}} \backslash K_{1}\right)$ such that $\left|\Omega_{x_{2}} \backslash\left(R_{2} \cup K_{1}\right)\right|<\frac{\varepsilon}{4}$, and, consequently, $\left|R_{2}\right|>\frac{\varepsilon}{2}$. Let $K_{2}=K_{1} \cup R_{2}=\bigcup_{i=1}^{n_{2}}\left[c_{i}, d_{i}\right]$. Then $\left|K_{2}\right|>\frac{\varepsilon}{2}+\frac{\varepsilon}{2}=\varepsilon$. Since $K_{2}$ is a compact set, we have for $\delta_{2}$ small enough $\left(x_{2}-\delta_{2}, x_{2}+\delta_{2}\right) \times K_{2} \subset \Omega$. Let $Z=\Omega_{x_{2}}$ and $N=\left(x_{2}-\delta_{2}, x_{2}+\delta_{2}\right) \cap M$. Continuing this process we obtain after $m$ steps for large $m \in \mathbb{N}\left|K_{m}\right|>|I|$, which is a contradiction.

Lemma 3.3. Let $A \subset I^{2}$ be a measurable set and let $M \subset I,|M|>0$. Then for every $\varepsilon>0$ there is a set $N \subset M,|N|>0$, such that

$$
\left|A_{x} \div A_{y}\right|<\varepsilon \quad \text { for all } \quad x, y \in N
$$

Proof. Let $\varepsilon>0$ be fixed. In the case $|A|=0$ it suffices to put $N=M$. Let $|A|>0$. Define $P=\left\{x ;\left|A_{x}\right|>0\right\}$. Clearly, $|P|>0$, whence either $|M \backslash P|>0$ or $|M \cap P|>0$. In the case $|M \backslash P|>0$, it suffices to put $N=M \backslash P$. Assume that $|M \backslash P|=0$. Denote $M_{1}=M \cap P$ and $B=\cup_{x \in M_{1}}\{x\} \times A_{x}$. Clearly, $|B|>0$. By the regularity of the Lebesgue measure there is an open set $\Omega, B \subset \Omega$, such that $|\Omega \backslash B|<\frac{\varepsilon}{4}\left|M_{1}\right|$. Set

$$
\begin{equation*}
Q=\left\{x \in M_{1} ;\left|\Omega_{x} \backslash B_{x}\right| \geq \frac{\varepsilon}{4}\right\} \tag{3.7}
\end{equation*}
$$

If $|Q|=\left|M_{1}\right|$, then the Fubini theorem implies $|\Omega \backslash B| \geq \frac{\varepsilon}{4}|Q|=\frac{\varepsilon}{4}\left|M_{1}\right|$, which is a contradiction. Therefore, $|Q|<\left|M_{1}\right|$.

Let $M_{2}$ be a set of all density points of $M_{1} \backslash Q$. By the Lebesgue density theorem we have $\left|M_{2}\right|=\left|M_{1} \backslash Q\right|>0$, and by (3.7) we obtain

$$
\left|\Omega_{x} \backslash B_{x}\right|=\left|\Omega_{x} \backslash A_{x}\right|<\frac{\varepsilon}{4} \quad \text { for all } \quad x \in M_{2}
$$

By Lemma 3.2, there are sets $Z \subset I$ and $N \subset M_{2},|N|>0$, such that

$$
\begin{equation*}
|\Omega \div Z|<\frac{\varepsilon}{8} \quad \text { for all } \quad x \in N \tag{3.8}
\end{equation*}
$$

Now, we fix $x, y \in N$. We shall estimate $\left|A_{x} \div A_{y}\right|$. Since

$$
A_{x} \backslash A_{y} \subset \Omega_{x} \backslash A_{y} \subset\left(\Omega_{x} \backslash \Omega_{y}\right) \cup\left(\Omega_{y} \backslash A_{y}\right),
$$

it is easy to verify that

$$
\begin{equation*}
\left|A_{x} \backslash A_{y}\right|<\left|\Omega_{x} \backslash \Omega_{y}\right|+\frac{\varepsilon}{4} . \tag{3.9}
\end{equation*}
$$

Moreover, $\Omega_{x} \backslash \Omega_{y} \subset\left(\Omega_{x} \backslash Z\right) \cup\left(Z \backslash \Omega_{y}\right)$ and $\Omega_{y} \backslash \Omega_{x} \subset\left(\Omega_{y} \backslash Z\right) \cup\left(Z \backslash \Omega_{x}\right)$, which together with (3.8) yields

$$
\left|\Omega_{x} \div \Omega_{y}\right| \leq\left|\Omega_{x} \div Z\right|+\left|\Omega_{y} \div Z\right|<\frac{\varepsilon}{4}
$$

Using (3.9), we obtain $\left|A_{x} \backslash A_{y}\right|<\frac{\varepsilon}{2}$, and, consequently, $\left|A_{x} \div A_{y}\right|<\varepsilon$. The proof is complete.

In the sequel we denote by $\left.f\right|_{K}$ the restriction of a function $f$ to a set $K$.
We shall use the following notation. Let $\mathcal{F}$ be some subset of the unit ball of $(X, v)$. Then we define

$$
F_{\mathcal{F}}(x)=F(x)=\sup _{f \in \mathcal{F}} \int_{I} \ell(x, t) f(t) d t, \quad x \in I
$$

and

$$
P=\underset{x \in I}{\operatorname{ess} \sup } F(x) .
$$

We have to prove that $F$ is measurable on $I$ and that $\|L\| \geq P$. We first adopt certain restrictions on $\ell$ and $\mathcal{F}$, which will be gradually chipped away later on.

Lemma 3.4. Let $K \subset I^{2}$ be a compact set. Assume that $\ell \in \mathcal{A}, \ell \geq 0,\left.\ell\right|_{K}$ is continuous, and $\ell=0$ on $I^{2} \backslash K$. Let $C>0$ and $\mathcal{F}=\left\{f ;\|f\|_{X, v} \leq 1,0 \leq f \leq C\right\}$. Then $F$ is a measurable function on $I$ and $\|L\| \geq P$.

Proof. By our assumptions on $K$ and $\ell$, there exists a constant $D>0$ such that $0 \leq \ell \leq D$ on $I^{2}$. Let $\varepsilon>0$. We divide the proof into three steps. In the first two steps we prove that $F$ is measurable and in the third step we show $\|L\| \geq P$.
Step 1. We claim that for a set $M \subset I,|M|>0$, there is a set $N \subset M,|N|>0$, and $f \in \mathcal{F}$, such that

$$
F(x)-\varepsilon(1+2 C+4 C D) \leq \int_{I} \ell(x, t) f(t) d t \leq F(x) \quad \text { for all } x \in N
$$

Let $|M|>0$. By Lemma 3.3, there is $M_{0} \subset M$, such that $\left|M_{0}\right|>0$ and

$$
\begin{equation*}
\left|K_{x} \div K_{y}\right|<\varepsilon \quad \text { for all } \quad x, y \in M_{0} . \tag{3.10}
\end{equation*}
$$

Now, choose $x_{0} \in M_{0}$ such that for every $\delta>0$ we have $\left|\left(x_{0}-\delta, x_{0}+\delta\right) \cap M_{0}\right|>0$. By the uniform continuity of $\left.\ell\right|_{K}$, there is a $\delta_{0}>0$ small enough and such that, for $x \in M_{1}=\left(x_{0}-\delta_{0}, x_{0}+\delta_{0}\right) \cap M_{0}$ and $t \in K_{x} \cap K_{x_{0}}$,

$$
\begin{equation*}
\left|\ell(x, t)-\ell\left(x_{0}, t\right)\right|<\varepsilon \tag{3.11}
\end{equation*}
$$

From the definition of $F(x)$ we obtain the existence of $f_{0} \in \mathcal{F}$ satisfying

$$
\begin{equation*}
F\left(x_{0}\right)-\varepsilon \leq \int_{I} \ell\left(x_{0}, t\right) f_{0}(t) d t \leq F\left(x_{0}\right) \tag{3.12}
\end{equation*}
$$

Set

$$
G(x)=\int_{I} \ell(x, t) f_{0}(t) d t \quad \text { for } x \in I
$$

Clearly,

$$
\begin{equation*}
G(x) \leq F(x) \quad \text { for a.e. } x \in I . \tag{3.13}
\end{equation*}
$$

Let $x \in M_{1}$ and $f \in \mathcal{F}$ be fixed. We denote

$$
R(x, f)=\int_{I}\left(\ell(x, t)-\ell\left(x_{0}, t\right)\right) f(t) d t
$$

Using (3.10), (3.11), and $0 \leq \ell \leq D$, we get

$$
\begin{aligned}
|R(x, f)| & \leq \int_{I}\left|\ell(x, t)-\ell\left(x_{0}, t\right)\right| f(t) d t \\
& =\int_{K_{x} \cap K_{x_{0}}}\left|\ell(x, t)-\ell\left(x_{0}, t\right)\right| f(t) d t \\
& +\int_{K_{x} \backslash K_{x_{0}}} \ell(x, t) f(t) d t+\int_{K_{x_{0}} \backslash K_{x}} \ell\left(x_{0}, t\right) f(t) d t \\
& \leq \varepsilon C+2 \varepsilon C D=\varepsilon(C+2 C D) .
\end{aligned}
$$

Now, setting $f \equiv f_{0}$ we have

$$
\begin{equation*}
\left|G(x)-G\left(x_{0}\right)\right| \leq \varepsilon(C+2 C D) \quad \text { for } x \in M_{1} . \tag{3.14}
\end{equation*}
$$

Let $R(x)=\sup _{f \in \mathcal{F}}|R(x, f)|$. We immediately obtain

$$
\begin{equation*}
0 \leq R(x) \leq \varepsilon(C+2 C D) \quad \text { for all } \quad x \in M_{1} . \tag{3.15}
\end{equation*}
$$

Since

$$
\int_{I} \ell(x, t) f(t) d t=\int_{I} \ell\left(x_{0}, t\right) f(t) d t+R(x, f),
$$

we have

$$
F(x)=\sup _{f \in \mathcal{F}}\left(\int_{I} \ell\left(x_{0}, t\right) f(t) d t+R(x, f)\right)
$$

and, consequently,

$$
F(x) \leq \sup _{f \in \mathcal{F}} \int_{I} \ell\left(x_{0}, t\right) f(t) d t+R(x) .
$$

We can rewrite the last inequality as $F(x) \leq F\left(x_{0}\right)+R(x), x \in M_{1}$. Thus, by the above inequalities, (3.14), (3.12), and (3.15), we obtain for $x \in M_{1}$

$$
\begin{aligned}
G(x) & \geq G\left(x_{0}\right)-\varepsilon(C+2 C D) \geq F\left(x_{0}\right)-\varepsilon(1+C+2 C D) \\
& \geq F(x)-R(x)-\varepsilon(1+C+2 C D) \geq F(x)-\varepsilon(1+2 C+4 C D) .
\end{aligned}
$$

Now, it suffices to use (3.13) and the last inequality, and to set $f=f_{0}$ and $N=M_{1}$ to prove our claim.
Step 2. Let $M=I$. By Step 1 , there exist $N_{1} \subset I,\left|N_{1}\right|>0$, and $f_{1} \in \mathcal{F}$ such that

$$
F(x)-\varepsilon(1+2 C+4 C D) \leq \int_{I} \ell(x, t) f_{1}(t) d t \leq F(x) \quad \text { for } \quad x \in N_{1}
$$

Assume that we have constructed sets $N_{\beta}$ and functions $f_{\beta}$ for all ordinal numbers $\beta<\alpha$, where $\alpha$ is a fixed countable ordinal number. Set $M=I \backslash \bigcup_{\beta<\alpha} N_{\beta}$. If $|M|=0$, we stop the construction. If $|M|>0$, then by Step 1 we have $N_{\alpha} \subset$ $I \backslash \bigcup_{\beta<\alpha} N_{\beta},\left|N_{\alpha}\right|>0$, and there is an $f_{\alpha} \in \mathcal{F}$ such that

$$
F(x)-\varepsilon(1+2 C+4 C D) \leq \int_{I} \ell(x, t) f_{\alpha}(t) d t \leq F(x) \quad \text { for } \quad x \in N_{\alpha}
$$

This process will stop after countably many steps. Hence, there exists a countable ordinal number $\gamma$ such that for $x \in N_{\beta}, \beta<\gamma$,

$$
\begin{equation*}
F(x)-\varepsilon(1+2 C+4 C D) \leq \int_{I} \ell(x, t) f_{\beta}(t) d t \leq F(x) \tag{3.16}
\end{equation*}
$$

and moreover

$$
\begin{align*}
& N_{\alpha} \cap N_{\beta}=\emptyset \quad \text { for } \alpha \neq \beta, \quad\left|N_{\beta}\right|>0 \quad \text { for } \quad \beta<\gamma ;  \tag{3.17}\\
& \left|I \backslash \bigcup_{\beta<\gamma} N_{\beta}\right|=0 \tag{3.18}
\end{align*}
$$

Define a function $H_{\varepsilon}$ by $H_{\varepsilon}(x)=\sum_{\beta<\gamma} \chi_{N_{\beta}}(x) \int_{I} \ell(x, t) f_{\beta}(t) d t$. Since for every $\beta<$ $\gamma$ the functions $x \mapsto \int_{I} \ell(x, t) f_{\beta}(t) d t$ and $\chi_{N_{\beta}}(x)$ are measurable, $H_{\varepsilon}$ is measurable as well. Moreover, according to (3.16), (3.17)and (3.18) we have for a.e. $x \in I$

$$
F(x)-\varepsilon(1+2 C+4 C D) \leq H_{\varepsilon}(x) \leq F(x)
$$

which implies

$$
F(x)=\lim _{n \rightarrow \infty} H_{1 / n}(x) \quad \text { for a.e. } \quad x \in I
$$

and, consequently, $F$ is measurable.
Step 3. We claim $\|L\| \geq P$. Observe that

$$
\|L\|=\sup _{\|f\|_{X, v} \leq 1} \operatorname{ess} \sup _{x \in I}\left|\int_{I} \ell(x, t) f(t) d t\right|=\sup _{\|f\|_{X, v} \leq 1} \operatorname{ess} \sup _{x \in I} \int_{I} \ell(x, t) f(t) d t .
$$

By the definition of $P$, there is a set $M,|M|>0$, such that

$$
P-\varepsilon \leq F(x) \leq P \quad \text { for all } \quad x \in M
$$

Now, by Step 1 , there is a set $N \subset M,|N|>0$, and a function $f_{0} \in \mathcal{F}$ such that

$$
\int_{I} \ell(x, t) f_{0}(t) d t \geq F(x)-\varepsilon(1+2 C+4 C D) \quad \text { for all } \quad x \in N
$$

Thus,

$$
\begin{aligned}
&\|L\|=\sup _{\|f\|_{X, v} \leq 1} \operatorname{ess} \sup _{x \in I} \int_{I} \ell(x, t) f(t) d t \\
& \geq \sup _{f \in \mathcal{F}} \operatorname{ess} \sup \\
& x \in N \\
& \geq \underset{I}{ } \ell(x, t) f(t) d t \\
& \geq P-\varepsilon(2+2 C+4 C D) .
\end{aligned}
$$

Letting $\varepsilon$ tend to zero we complete the proof.
Lemma 3.5. Assume that $\ell \in \mathcal{A}$ and $0 \leq \ell \leq D$ for some $D>0$. Let $C>0$. Define $\mathcal{F}=\left\{f ;\|f\|_{X, v} \leq 1\right.$ and $\left.0 \leq f \leq C\right\}$. Then $F$ is measurable and $\|L\| \geq P$.
Proof. Let $K_{n}$ be a sequence of compact sets, $K_{n} \nearrow I^{2}$, such that $\left.\ell\right|_{K_{n}}$ are continuous functions. Set $\ell_{n}(x, t)=\ell(x, t) \chi_{K_{n}}(x, t)$. Since $0 \leq \ell_{n} \leq \ell$ we have by Lemma $2.3 \frac{\ell(x, .)}{v(.)} \in\left(X^{\prime}, v\right)$ almost everywhere in $I$ and so, $\frac{\ell_{n}(x, .)}{v(.)} \in\left(X^{\prime}, v\right)$ which implies again by Lemma $2.3 \ell_{n} \in \mathcal{A}$. Set

$$
\begin{aligned}
L_{n} f(x) & =\int_{I} \ell_{n}(x, t) f(t) d t \quad \text { for } f \in(X, v) \\
F_{n}(x) & =\sup _{f \in \mathcal{F}} L_{n} f(x) \text { and } \\
P_{n} & =\underset{x \in I}{\operatorname{ess} \sup } F_{n}(x)
\end{aligned}
$$

Clearly, $0 \leq \ell_{n} \nearrow \ell$ a.e. in $I^{2}$. Then there is a set $I_{1} \subset I,\left|I \backslash I_{1}\right|=0$, such that for every $x \in I_{1}$ we have $0 \leq \ell_{n}(x, \cdot) \nearrow \ell(x, \cdot)$ a.e. in $I$. Thus, $0 \leq \ell_{n}(x, t) f(t) \nearrow$ $\ell(x, t) f(t)$ for $x \in I_{1}$ and $f \geq 0$, whence

$$
0 \leq \int_{I} \ell_{n}(x, t) f(t) d t \nearrow \int_{I} \ell(x, t) f(t) d t \quad \text { for } x \in I_{1} \text { and } f \geq 0
$$

Now, it is not difficult to verify that

$$
0 \leq F_{n}(x) \nearrow F(x) \text { for } x \in I_{1} .
$$

By Lemma 3.4, $F_{n}$ are measurable. Thus $F$ is measurable as a pointwise limit of $F_{n}$. Moreover, it is readily seen that

$$
\begin{equation*}
0 \leq P_{n} \nearrow P \tag{3.19}
\end{equation*}
$$

Moreover, it is clear that

$$
\|L\|=\sup _{\|f\|_{X, v} \leq 1, f \geq 0} \operatorname{ess}_{x \in I} \int_{I} \ell(x, t) f(t) d t,
$$

and

$$
\left\|L_{n}\right\|=\sup _{\|f\|_{X, v} \leq 1} \operatorname{ess} \sup _{x \in I} \int_{I} \ell_{n}(x, t) f(t) d t .
$$

For $f \geq 0$ we have $\int_{I} \ell_{n}(x, t) f(t) d t \leq \int_{I}(x, t) f(t) d t$. We thus obtain

$$
\begin{equation*}
\|L\| \geq\left\|L_{n}\right\| \quad \text { for any } \quad n \in \mathbb{N} . \tag{3.20}
\end{equation*}
$$

Observe that the kernels $\ell_{n}$ satisfy the assumptions of Lemma 3.5 and therefore $\left\|L_{n}\right\| \geq P_{n}$, which via (3.19) and (3.20) implies $\|L\| \geq P$. The proof is complete.

For $M \subset \mathbb{R}$ measurable we denote by $\mathfrak{D}(M)$ the set of all points of $M$ which are the Lebesgue density points of $M$. Recall that $|M \backslash \mathfrak{D}(M)|=0$.

Lemma 3.6. Let $A \subset I^{2}$ and $M \in I$ be measurable sets, $|M|>0$. Then there exists $N \subset M,|M \backslash N|=0, N=\mathfrak{D}(N)$ with the following property: for every $x \in N$ and $\varepsilon>0$ there is a set $B \subset N$, such that

$$
\begin{align*}
B & =\mathfrak{D}(B),  \tag{3.21}\\
x & \in B  \tag{3.22}\\
\mid A_{y} & \div A_{z} \mid<\varepsilon \quad \text { for } \quad y, z \in B . \tag{3.23}
\end{align*}
$$

Proof. Fix $\varepsilon>0$. By Lemma 3.3, there is a set $\widetilde{M}_{\varepsilon, 1} \subset M,\left|\widetilde{M}_{\varepsilon, 1}\right|>0$, such that $\left|A_{y} \div A_{z}\right|<\varepsilon$ for $y, z \in \widetilde{M}_{\varepsilon, 1}$. Set $M_{\varepsilon, 1}=\mathfrak{D}\left(\widetilde{M}_{\varepsilon, 1}\right)$. Clearly, $\left|\widetilde{M}_{\varepsilon, 1} \backslash M_{\varepsilon, 1}\right|=0$ and, consequently, $\left|M_{\varepsilon, 1}\right|>0$. Assume that we have constructed for an ordinal number $\alpha$ the sets $M_{\varepsilon, \beta}, \beta<\alpha$, such that for any $\beta$ we have

$$
\left|A_{y} \div A_{z}\right|<\varepsilon \quad \text { for } \quad y, z \in M_{\varepsilon, \beta} \quad \text { and } \quad M_{\varepsilon, \beta}=\mathfrak{D}\left(M_{\varepsilon, \beta}\right) \text {. }
$$

If $\left|M \backslash \bigcup_{\beta<\alpha} M_{\varepsilon, \beta}\right|=0$, we set $M_{\varepsilon}=\bigcup_{\beta<\alpha} M_{\varepsilon, \beta}$ and we stop the construction. If $\left|M \backslash \bigcup_{\beta<\alpha} M_{\varepsilon, \beta}\right|>0$, then, by Lemma 3.3, there is an $\widetilde{M}_{\varepsilon, \alpha} \subset$ $M \backslash \bigcup_{\beta<\alpha} M_{\varepsilon, \beta},\left|\widetilde{M}_{\varepsilon, \alpha}\right|>0$ and $\left|A_{y} \div A_{z}\right|<\varepsilon$ for $y, z \in \widetilde{M}_{\varepsilon, \alpha}$. Set $M_{\varepsilon, \alpha}=\mathfrak{D}\left(\widetilde{M}_{\varepsilon, \alpha}\right)$.

This process will stop after a countable number of steps. Hence there is a countable ordinal $\gamma_{\varepsilon}$ such that

$$
\left|M \backslash \bigcup_{\beta<\gamma_{\varepsilon}} M_{\varepsilon, \beta}\right|=0
$$

and for $\beta<\gamma_{\varepsilon}$ we have

$$
M_{\varepsilon, \beta}=\mathfrak{D}\left(M_{\varepsilon, \beta}\right), \quad \text { and } \quad\left|A_{y} \div A_{z}\right|<\varepsilon \quad \text { for } \quad y, z \in M_{\varepsilon, \beta} .
$$

Let us define

$$
M_{\varepsilon}=\bigcup_{\beta<\gamma_{\varepsilon}} M_{\varepsilon, \beta} .
$$

Set

$$
\widetilde{N}=\bigcap_{n=1}^{\infty} M_{\frac{1}{n}} \text { and } N=D(\widetilde{N})
$$

Evidently, $N \subset M$. Moreover, $\left|M \backslash M_{\frac{1}{n}}\right|=0$ for $n \in \mathbb{N}$, hence $\left|M \backslash \bigcap_{n=1}^{\infty} M_{\frac{1}{n}}\right|=$ $|M \backslash \tilde{N}|=0$, and, as $|\widetilde{N} \backslash N|=0$, we have $|M \backslash N|=0$. Clearly, $N=\mathfrak{D}(N)$.

Let $\varepsilon>0$ and $x \in N$. Fix $n$ such that $\frac{1}{n}<\varepsilon$. Then $x \in M_{\frac{1}{n}}=\bigcup_{\beta<\gamma_{\frac{1}{n}}} M_{\frac{1}{n}, \beta}$. Let $\alpha<\gamma_{\frac{1}{n}}$ be an ordinal number such that $x \in M_{\frac{1}{n}, \alpha}$. By the construction we have $M_{\frac{1}{n}, \alpha}=\mathfrak{D}\left(M_{\frac{1}{n}, \alpha}\right)$. Moreover,

$$
\left|A_{y} \div A_{z}\right|<\frac{1}{n}<\varepsilon \quad \text { for } \quad y, z \in M_{\frac{1}{n}, \alpha}
$$

Now, to prove (3.21), (3.22) and (3.23), if suffices to take $B=M_{\frac{1}{n}, \alpha} \cap N$.
Lemma 3.7. Let $\ell \in \mathcal{A}$ and let $|\ell| \leq D$ a.e. in $I^{2}$ for some $D>0$. Let $C>0$. Set $\mathcal{F}=\left\{f ;\|f\|_{X, v} \leq 1\right.$ and $\left.|f| \leq C\right\}$. Then $F$ is measurable and $\|L\| \geq P$.

Proof. Since $\ell \in \mathcal{A}$, there is a $J \subset I,|I \backslash J|=0$, and the function $x \mapsto$ $\int_{I} \ell(x, t) f(x) d t$ is well-defined for all $x \in J$ and $f \in(X, v)$. Then for $x \in J$

$$
\begin{equation*}
F(x)=\sup _{f \in \mathcal{F}} \int_{I}|\ell(x, t)| f(t) d t \tag{3.24}
\end{equation*}
$$

By Lemma 3.5, the last expression is a measurable function. Thus, $F$ is measurable.
Let $\varepsilon>0$. Then there is a set $M \subset J,|M|>0$, such that

$$
\begin{equation*}
P-\varepsilon \leq F(x) \leq P \quad \text { for all } \quad x \in M \tag{3.25}
\end{equation*}
$$

Set
$K^{+}=\left\{(x, y) \in I^{2} ; \ell(x, t)>0\right\}, \quad K^{-}=\left\{(x, y) \in I^{2} ; \ell(x, t)<0\right\}, \quad K=K^{+} \cup K^{-}$, and

$$
P K^{+}=\left\{x \in J ;\left|K_{x}^{+}\right|>0\right\}, \quad P K^{-}=\left\{x \in J ;\left|K_{x}^{-}\right|>0\right\} .
$$

Let further

$$
\begin{array}{lr}
M_{1}=P K^{+} \cap P K^{-} \cap M, & M_{2}=\left(P K^{+} \backslash P K^{-}\right) \cap M \\
M_{3}=\left(P K^{-} \backslash P K^{+}\right) \cap M, & M_{4}=\left(I \backslash\left(P K^{+} \cup P K^{-}\right)\right) \cap M
\end{array}
$$

Clearly, $M=\bigcup_{i=1}^{4} M_{i}$, and at least one of these sets has a positive measure. Set

$$
\begin{aligned}
\ell_{i}(x, t) & =\ell(x, t) \chi_{M_{i}}(x) \\
\left(L_{i} f\right)(x) & =\int_{I} \ell_{i}(x, t) f(t) d t
\end{aligned}
$$

Clearly, by Lemma 2.3 we have $\ell_{i} \in \mathcal{A}$ for $1 \leq i \leq 4$. Fix $i \in\{2,3,4\}$ and assume $\left|M_{i}\right|>0$. It is easy to see that $0 \leq \ell_{2} \leq D,-D \leq \ell_{3} \leq 0, \ell_{4}=0$ and

$$
\begin{equation*}
\|L\| \geq\left\|L_{i}\right\| \tag{3.26}
\end{equation*}
$$

Define

$$
P_{i}=\operatorname{ess} \sup _{x \in I} \sup _{\|f\|_{X, v} \leq 1,0 \leq f \leq C} \int_{I}\left|\ell_{i}(x, t)\right| f(t) d t
$$

Then, by the definition of $\ell_{i}$ and (3.24), we have

$$
\begin{aligned}
P_{i} & \geq \underset{x \in M_{i}}{\operatorname{ess} \sup _{\|f\|_{X, v} \leq 1,0 \leq f \leq C}} \sup _{I}\left|\ell_{i}(x, t)\right| f(t) d t \\
& =\underset{x \in M_{i}}{\operatorname{ess} \sup _{\|f\|_{X, v} \leq 1,0 \leq f \leq C}} \sup _{I}|\ell(x, t)| f(t) d t=\underset{x \in M_{i}}{\operatorname{ess} \sup } F(x) .
\end{aligned}
$$

By Lemma 3.5 we have $\left\|L_{i}\right\| \geq P_{i}$. Therefore, using also (3.25) and (3.26), we have (3.27)

$$
\|L\| \geq P-\varepsilon
$$

Now let us assume that $\left|M_{2}\right|=\left|M_{3}\right|=\left|M_{4}\right|=0$. Then $\left|M_{1}\right|>0$. There exist sequences of compact sets $K_{n}^{+}, K_{n}^{-}$such that $K_{n}^{+} \nearrow K^{+}, K_{n}^{-} \nearrow K^{-}$and moreover $\left.\ell\right|_{K_{n}^{+}},\left.\ell\right|_{K_{n}^{-}}$are continuous functions. Set $K_{n}=K_{n}^{+} \cup K_{n}^{-}$. Fix $n \in \mathbb{N}$. Now, Lemma 3.6 guarantees the existence of sets $N_{n}^{+} \subset M_{1},\left|M_{1} \backslash N_{n}^{+}\right|=0$ and $N_{n}^{+}=\mathfrak{D}\left(N_{n}^{+}\right)$ such that for any $x \in N_{n}^{+}$there is a set $N_{x, n}^{+} \subset N_{n}^{+}$which satisfies

$$
\begin{align*}
N_{x, n}^{+} & =\mathfrak{D}\left(N_{x, n}^{+}\right),  \tag{3.28}\\
x & \in N_{x, n}^{+},  \tag{3.29}\\
\mid K_{n, y}^{+} & \div K_{n, z}^{+} \mid<\varepsilon \quad \text { for } \quad y, z \in N_{x, n}^{+} . \tag{3.30}
\end{align*}
$$

Analogously, there is a set $N_{n}^{-}$with $N_{n}^{-} \subset M_{1},\left|M_{1} \backslash N_{n}^{-}\right|=0, N_{n}^{-}=\mathfrak{D}\left(N_{n}^{-}\right)$and for any $x \in N_{n}^{-}$we have a set $N_{x, n}^{-} \subset N_{n}^{-}$such that

$$
\begin{align*}
N_{x, n}^{-} & =\mathfrak{D}\left(N_{x, n}^{-}\right)  \tag{3.31}\\
x & \in N_{x, n}^{-}  \tag{3.32}\\
\mid K_{n, y}^{-} & \div K_{n, z}^{-} \mid<\varepsilon \quad \text { for } \quad y, z \in N_{x, n}^{-} . \tag{3.33}
\end{align*}
$$

Set $\widetilde{N}_{1}=\bigcap_{n=1}^{\infty}\left(N_{n}^{+} \cap N_{n}^{-}\right)$and $N_{1}=\mathfrak{D}\left(\widetilde{N}_{1}\right)$. Obviously, $\left|M_{1} \backslash N_{1}\right|=0$ and, consequently, $\left|N_{1}\right|>0$. Denote for $n \in \mathbb{N}$

$$
P K_{n}^{+}=\left\{x \in J ;\left|K_{n, x}^{+}\right|>0\right\}, \quad P K_{n}^{-}=\left\{x \in J ;\left|K_{n, x}^{-}\right|>0\right\}
$$

By the Fubini theorem, $\left|M_{1}\right|>0$, and $K_{n} \nearrow K$, we can choose an $n_{0} \in \mathbb{N}$ large enough in order that

$$
\left|P K_{n}^{+} \cap P K_{n}^{-} \cap M_{1}\right|>0 \quad \text { for all } \quad n \geq n_{0}
$$

Set

$$
A_{n}=\left\{x \in J ;\left|K_{x}^{+} \backslash K_{n, x}^{+}\right|<\varepsilon \text { and }\left|K_{x}^{-} \backslash K_{n, x}^{-}\right|<\varepsilon\right\} .
$$

Since for any $n \in \mathbb{N}$ the functions $x \mapsto\left|K_{x}^{+} \backslash K_{n, x}^{+}\right|$and $x \mapsto\left|K_{x}^{-} \backslash K_{n}\right|$ are measurable, $A_{n}$ are measurable as well. Moreover, $A_{n}$ is a non-decreasing sequence of sets.

Since $K_{n}^{+} \nearrow K^{+}$and $K_{n}^{-} \nearrow K^{-}$, we obtain by the Fubini theorem $K_{n, x}^{+} \nearrow K_{x}^{+}$ and $K_{n, x}^{-} \nearrow K_{x}^{-}$for a.e. $x \in J$. So, there is a set $J_{1} \subset J,\left|J \backslash J_{1}\right|=0$ such that

$$
\begin{equation*}
K_{n, x}^{+} \nearrow K_{x}^{+}, K_{n, x}^{-} \nearrow K_{x}^{-} \quad \text { for all } x \in J_{1} \tag{3.34}
\end{equation*}
$$

Using the Fubini theorem again, we can find an $n_{1} \in \mathbb{N}$ such that $\left|A_{n} \cap N_{1}\right|>0$ for any $n \geq n_{1}$. Let $n_{2}=\max \left\{n_{0}, n_{1}\right\}$. Then we see that

$$
\begin{equation*}
\left|K_{x}^{+} \backslash K_{n, x}^{+}\right|<\varepsilon \quad \text { and } \quad\left|K_{x}^{-} \backslash K_{n, x}^{-}\right|<\varepsilon \quad \text { for all } x \in A_{n} \cap N_{1}, \quad n \geq n_{2} \tag{3.35}
\end{equation*}
$$

Define $\ell_{n}^{+}=\ell \chi_{K_{n}^{+}}$and $\ell_{n}^{-}=\ell \chi_{K_{n}^{-}}$. Set $\ell_{n}=\ell_{n}^{+}-\ell_{n}^{-}$. Let $N_{2}=A_{n_{1}} \cap N_{1} \cap J_{1}$. Clearly, $\left|N_{2}\right|>0$.

Let $x_{0} \in \mathfrak{D}\left(N_{2}\right)$. Since $x_{0} \in N_{2} \subset N_{1} \subset M_{1} \subset M$, we have from (3.25) and the definition of $F\left(x_{0}\right)$ a function $f_{0}(t)$ such that

$$
\begin{equation*}
P-2 \varepsilon \leq\left|\int_{I} \ell\left(x_{0}, t\right) f_{0}(t) d t\right| \leq P \tag{3.36}
\end{equation*}
$$

Clearly, (3.34) and the fact that $x_{0} \in J_{1}$ imply $\ell_{n}^{+}\left(x_{0}, t\right) \nearrow \ell^{+}\left(x_{0}, t\right), \ell_{n}^{-}\left(x_{0}, t\right) \nearrow$ $\ell^{-}\left(x_{0}, t\right)$. Since the constant function $C D$ can serve as an integrable majorant, we can write

$$
\int_{I} \ell_{n}^{+}\left(x_{0}, t\right) f_{0}(t) d t \rightarrow \int_{I} \ell^{+}\left(x_{0}, t\right) f_{0}(t) d t
$$

and

$$
\int_{I} \ell_{n}^{-}\left(x_{0}, t\right) f_{0}(t) d t \rightarrow \int_{I} \ell^{-}\left(x_{0}, t\right) f_{0}(t) d t
$$

Hence, there exists an $n_{3} \geq n_{2}$ such that

$$
\int_{I} \ell^{+}\left(x_{0}, t\right) f_{0}(t) d t-\varepsilon \leq \int_{I} \ell_{n_{3}}^{+}\left(x_{0}, t\right) f_{0}(t) d t \leq \int_{I} \ell^{+}\left(x_{0}, t\right) f_{0}(t) d t+\varepsilon
$$

and

$$
\int_{I} \ell^{-}\left(x_{0}, t\right) f_{0}(t) d t-\varepsilon \leq \int_{I} \ell_{n_{3}}^{-}\left(x_{0}, t\right) f_{0}(t) d t \leq \int_{I} \ell^{-}\left(x_{0}, t\right) f_{0}(t) d t+\varepsilon .
$$

Using these inequalities, $\ell_{n}\left(x_{0}, t\right)=\ell_{n}^{+}\left(x_{0}, t\right)-\ell_{n}^{-}\left(x_{0}, t\right)$, and $\ell\left(x_{0}, t\right)=\ell^{+}\left(x_{0}, t\right)-$ $\ell^{-}\left(x_{0}, t\right)$, we obtain

$$
\left|\int_{I} \ell\left(x_{0}, t\right) f_{0}(t) d t\right|-2 \varepsilon \leq\left|\int_{I} \ell_{n_{3}}\left(x_{0}, t\right) f_{0}(t) d t\right| \leq\left|\int_{I} \ell\left(x_{0}, t\right) f_{0}(t) d t\right|+2 \varepsilon .
$$

Together with (3.36), this yields

$$
\begin{equation*}
P-4 \varepsilon \leq\left|\int_{I} \ell_{n_{3}}\left(x_{0}, t\right) f_{0}(t) d t\right| \leq P+2 \varepsilon . \tag{3.37}
\end{equation*}
$$

Since $\left.\ell\right|_{K_{n 3}}$ is continuous, there is an $\alpha_{0}>0$ such that, for $x \in\left(x_{0}-\alpha_{0}, x_{0}+\alpha_{0}\right)$ and $t \in K_{n_{3}, x_{0}} \cap K_{n_{3}, x}$,

$$
\begin{equation*}
\left|\ell_{n_{3}}(x, t)-\ell_{n_{3}}\left(x_{0}, t\right)\right|<\varepsilon \tag{3.38}
\end{equation*}
$$

Set $N_{3}=\left(x_{0}-\alpha_{0}, x_{0}+\alpha_{0}\right) \cap N_{2} \cap N_{x_{0}, n_{3}}^{+} \cap N_{x_{0}, n_{3}}^{-}$. We know that $x_{0} \in \mathfrak{D}\left(N_{2}\right)$. By (3.28), (3.29), (3.31) and (3.32) we have $x_{0} \in N_{3}, x_{0} \in \mathfrak{D}\left(N_{3}\right)$ and, consequently, $\left|N_{3}\right|>0$.

Recall that $N_{3}$ satisfies the following inclusions:

$$
\begin{align*}
& N_{3} \subset N_{2} \subset A_{n_{1}},  \tag{3.39}\\
& N_{3} \subset\left(x_{0}-\alpha_{0}, x_{0}+\alpha_{0}\right),  \tag{3.40}\\
& N_{3} \subset N_{x_{0}, n_{3}}^{+} \cap N_{x_{0}, n_{3}}^{-} . \tag{3.41}
\end{align*}
$$

We shall estimate

$$
G(x)=\int_{I} \ell(x, t) f_{0}(t) d t, \quad x \in N_{3} .
$$

Clearly, for a fixed $x \in N_{3}$, we have

$$
\begin{aligned}
G(x) & =\int_{I}\left(\ell(x, t)-\ell_{n_{3}}(x, t)\right) f_{0}(t) d t \\
& +\int_{K_{n_{3}, x_{0}} \cap K_{n_{3}, x}}\left(\ell_{n_{3}}(x, t)-\ell_{n_{3}}\left(x_{0}, t\right)\right) f_{0}(t) d t \\
& +\int_{K_{n_{3}, x_{0} \backslash K_{n_{3}, x}} \ell_{n_{3}}(x, t) f_{0}(t) d t} \\
& +\int_{K_{n_{3}, x} \backslash K_{n_{3}, x_{0}}} \ell_{n_{3}}\left(x_{0}, t\right) f_{0}(t) d t \\
& +\int_{I} \ell_{n_{3}}\left(x_{0}, t\right) f_{0}(t) d t=I_{1}+I_{2}+I_{3}+I_{4}+I_{5} .
\end{aligned}
$$

Now, evidently,

$$
\begin{aligned}
\left|I_{1}\right| & \leq \int_{I}\left|\ell(x, t)-\ell_{n_{3}}(x, t)\right|\left|f_{0}(t)\right| d t \\
& \leq \int_{K_{x}^{+} \backslash K_{n_{3}, x}^{+}} \ell^{+}(x, t)\left|f_{0}(t)\right| d t+\int_{K_{x}^{-} \backslash K_{n_{3}}^{-}, x}\left|\ell^{-}(x, t)\right|\left|f_{0}(t)\right| d t
\end{aligned}
$$

By (3.39), $x \in N_{3} \subset A_{n_{1}}$. Since $n_{3} \geq n_{2} \geq n_{1}$, we have by (3.35) $\left|I_{1}\right| \leq 2 \varepsilon C D$. By (3.38) and (3.40), $\left|I_{2}\right| \leq \varepsilon C$. Using (3.30), (3.33) and (3.41), we get $\left|K_{n, x}^{+} \div K_{n, x_{0}}^{+}\right|<$ $\varepsilon$ and $\left|K_{n, x}^{-} \div K_{n, x_{0}}^{-}\right|<\varepsilon$, and therefore

$$
\left|I_{3}\right| \leq \varepsilon C D, \quad\left|I_{4}\right|<\varepsilon C D .
$$

Now, (3.37) and the estimates of $I_{1}, I_{2}, I_{3}, I_{4}$ give

$$
\begin{aligned}
&\|L\| \geq \sup _{f \in \mathcal{F}}^{\operatorname{sess}} \sup \\
& x \in I \\
&=\underset{x \in N_{3}}{\operatorname{ess} \sup }|G(x)| \geq\left|I_{5}\right|-\left|I_{1}\right|-\left|I_{2}\right|-\left|I_{3}\right|-\left|I_{4}\right| \geq P-\varepsilon(4+C+4 C D)
\end{aligned}
$$

We have proved that if $\left|M_{2}\right|=\left|M_{3}\right|=\left|M_{4}\right|=0$, then either $\|L\| \geq P-\varepsilon$ or $\|L\| \geq P-\varepsilon(4+C+C D)$. Together with (3.27) this yields

$$
\|L\| \geq P-\varepsilon(4+C+4 C D) .
$$

Letting $\varepsilon$ tend to zero, we obtain $\|L\| \geq P$, and the proof is complete.
Lemma 3.8. Let $\ell \in \mathcal{A},|\ell| \leq D$ in $I^{2}$ for some $D>0$ and let $\mathcal{F}$ be the unit ball of $(X, v)$. Then $F$ is measurable. Moreover, $\|L\| \geq P$.
Proof. Let $\mathcal{F}_{C}=\left\{f ;\|f\|_{X, v} \leq 1,|f| \leq C\right\}$ for any $C>0$. Let $a>0$ and $h \in \mathfrak{M}(I)$. We denote

$$
h_{a}(t)=\left\{\begin{array}{lll}
a & \text { if } & h(t)>a \\
h(t) & \text { if } & |h(t)| \leq a \\
-a & \text { if } & h(t)<-a
\end{array}\right.
$$

We define $F_{C}(x)=\sup _{f \in \mathcal{F}_{C}}\left|\int_{I} \ell(x, t) f(t) d t\right|$.
Let $J \subset I,|I \backslash J|=0$ and assume that $\int_{I} \ell(x, t) f(t) d t$ exists for any $x \in J$ and $f \in(X, v)$. Fix $x \in J$. Clearly, $\int_{I} h_{C} \rightarrow \int_{I} h$ for $C \rightarrow \infty$ if $\int_{I} h$ exists in the Lebesgue sense. Then

$$
\left|\int_{I} \ell(x, t) f_{C}(t) d t\right| \rightarrow\left|\int_{I} \ell(x, t) f(t) d t\right| \quad \text { for } C \rightarrow \infty
$$

It is not difficult to prove from the above convergence that

$$
F_{C}(x) \nearrow F(x) .
$$

By Lemma 3.7, the functions $F_{C}(x)$ are measurable and therefore $F(x)$ is measurable as a monotone pointwise limit of $F_{C}(x)$.

Moreover, as $F_{C}(x) \nearrow F(x)$ a.e. in $I$, we have also $P_{C} \nearrow P$. Now, Lemma 3.7 implies $\|L\| \geq P_{C}$ for any $C>0$, and thus $\|L\| \geq P$. The proof is complete.

Lemma 3.9. Let $I=[0,1]$. Let $\delta>0$ and denote

$$
\mathcal{M}=\{A ; A \in \mathfrak{M}(I),|A|<\delta\} .
$$

Then there exists a countable system $\mathcal{C}=\left\{M_{i}\right\}_{i \in \mathbb{N}}$ of sets, $\left|M_{i}\right|<\delta$, such that for every $A \in \mathcal{M}$ and $\varepsilon>0$ there is a $k \in \mathbb{N}$ such that $\left|A \div M_{k}\right|<\varepsilon$.
Proof. Set
$\mathcal{C}=\left\{M \subset I ; M=\bigcup_{i=1}^{n}\left(a_{i}, b_{i}\right), n \in \mathbb{N}, a_{i}, b_{i}\right.$ rational, $\left(a_{i}, b_{i}\right) \cap\left(a_{j}, b_{j}\right)=\emptyset$ for $i \neq j$

$$
\text { and } \left.\sum_{i=1}^{n}\left(b_{i}-a_{i}\right)<\delta\right\} .
$$

Clearly, $\mathcal{C}$ is a countable system, i.e. $\mathcal{C}=\left\{M_{i}\right\}_{i \in \mathbb{N}}$.
Now, let $A \in \mathcal{M}$ and $\varepsilon>0$. Fix a $\gamma$ such that $0<\gamma<\min \left\{\frac{\varepsilon}{3}, \delta-|A|\right\}$. By the regularity of the Lebesgue measure, there is an open set $G=\bigcup_{i=1}^{\infty}\left(c_{i}, d_{i}\right)$ such that $A \subset G$ and

$$
\begin{equation*}
|G \backslash A|<\gamma \tag{3.42}
\end{equation*}
$$

Since $G \subset I$, we have $\sum_{i=1}^{\infty}\left(c_{i}-d_{i}\right) \leq 1$, and there exists an $n \in \mathbb{N}$ such that the set $G_{n}$, defined by $G_{n}=\bigcup_{i=1}^{n}\left(c_{i}, d_{i}\right)$, satisfies

$$
\begin{equation*}
\left|G \backslash G_{n}\right|<\gamma \tag{3.43}
\end{equation*}
$$

Let $a_{i}, b_{i} \in \mathbb{Q}, i=1,2, \ldots, n$, are such that

$$
\left(a_{i}, b_{i}\right) \subset\left(c_{i}, d_{i}\right) \quad \text { and } \quad\left|\left(c_{i}, d_{i}\right) \backslash\left(a_{i}, b_{i}\right)\right|<\frac{\gamma}{n}
$$

Set $M=\bigcup_{i=1}^{n}\left(a_{i}, b_{i}\right)$. Clearly, $M \subset G_{n}$ and

$$
\begin{equation*}
\left|G_{n} \backslash M\right| \leq \sum_{i=1}^{n}\left|\left(c_{i}, d_{i}\right) \backslash\left(a_{i}, b_{i}\right)\right|<\gamma \tag{3.44}
\end{equation*}
$$

Evidently, we have from (3.42)

$$
|M| \leq|M \backslash A|+|A| \leq|G \backslash A|+|A| \leq \gamma+|A|<\delta,
$$

which implies $M \in \mathcal{C}$. Moreover, due to (3.42), (3.43), and (3.44) we can write

$$
|A \div M|=|A \backslash M|+|M \backslash A| \leq\left|G \backslash G_{n}\right|+\left|G_{n} \backslash M\right|+|G \backslash A| \leq 3 \gamma<\varepsilon
$$

which completes the proof.
Lemma 3.10. Let $\ell \in \mathcal{A}$ and let $\mathcal{F}$ be the unit ball of $(X, v)$. Then $F$ is measurable and $\|L\| \geq P$.

Proof. Since $\ell \in \mathcal{A}$, there is a set $J \subset I,|I \backslash J|=0$, and such that $\int_{I} \ell(x, t) f(t) d t$ has a sense for any $x \in J$ and $f \in(X, v)$. Set $B_{n}=\left\{(x, y) \in I^{2} ;|\ell(x, t)| \leq n\right\}$. Define

$$
\ell_{n}(x, t)=\ell(x, t) \chi_{B_{n}}(x, t), \quad\left(L_{n} f\right)(x)=\int_{I} \ell_{n}(x, t) f(t) d t .
$$

Remark that by Lemma 2.3 we immediately obtain $\ell_{n} \in \mathcal{A}$.
Step 1. Now we claim that $F$ is measurable. Note that $F(x)$ is defined for every $x \in J$. Fix $x \in J$. Clearly, $\left|\ell_{n}(x, t)\right| \nearrow|\ell(x, t)|$ in $I^{2}$, and, consequently,

$$
\begin{equation*}
\left|\ell_{n}(x, t)\right| f(t) \nearrow|\ell(x, t)| f(t) \quad \text { for any } \quad f \geq 0 \tag{3.45}
\end{equation*}
$$

It is easy to see that

$$
F(x)=\sup _{\|f\|_{X, v} \leq 1, f \geq 0} \int_{I}|\ell(x, t)| f(t) d t .
$$

By (3.45), we have for $f \geq 0$

$$
\int_{I}\left|\ell_{n}(x, t)\right| f(t) d t \nearrow \int_{I}|\ell(x, t)| f(t) d t
$$

and, consequently,

$$
F_{n}(x):=\sup _{\|f\|_{X, v} \leq 1, f \geq 0} \int_{I}\left|\ell_{n}(x, t)\right| f(t) d t \nearrow F(x)
$$

The function $F_{n}$ can be expressed also by

$$
\begin{equation*}
F_{n}(x)=\sup _{\|f\|_{X, v} \leq 1}\left|\int_{I} \ell_{n}(x, t) f(t) d t\right| \tag{3.46}
\end{equation*}
$$

Since $\ell_{n} \in \mathcal{A}$, we have from Lemma 3.8 that $F_{n}$ are measurable. Then the fact that $F_{n}(x) \nearrow F(x)$ for any $x \in J$ shows that $F$ is measurable.

Step 2. We will prove the inequality

$$
\begin{equation*}
\|L\| \geq\left\|L_{n}\right\| \text { for any } \quad n \in \mathbb{N} \tag{3.47}
\end{equation*}
$$

Fix $n \in \mathbb{N}$. The norms $\|L\|$ and $\left\|L_{n}\right\|$ are well defined because $\ell_{n}, \ell \in \mathcal{A}$.
If $\|L\|=\infty$, then (3.47) is trivial. Assume that $\|L\|<\infty$.
If $\left\|L_{n}\right\|=0$, then (3.47) is evident. Suppose $\left\|L_{n}\right\|>0$. Choose $0<\varepsilon_{0}<\frac{1}{\sqrt{2}}$ such that $\varepsilon_{0} \leq\left\|L_{n}\right\|$ is $\left\|L_{n}\right\|<\infty$ and $\|L\|<\frac{1}{\varepsilon_{0}}-2 \varepsilon_{0}$ if $\left\|L_{n}\right\|=\infty$. For $\varepsilon \in\left(0, \varepsilon_{0}\right)$ we define

$$
D_{\varepsilon}=\left\{\begin{array}{llll}
\left\|L_{n}\right\|-\varepsilon & \text { if }\left\|L_{n}\right\|<\infty & \text { and } \quad \varepsilon_{0}<\left\|L_{n}\right\| ;  \tag{3.48}\\
\frac{1}{\varepsilon} & \text { if }\left\|L_{n}\right\|=\infty & \text { and } & \|L\|<\frac{1}{\varepsilon_{0}}-2 \varepsilon_{0}
\end{array}\right.
$$

By the definition of $\left\|L_{n}\right\|$, there exists a function $f_{0},\left\|f_{0}\right\|_{X, v} \leq 1$, and a set $M \subset J,|M|>0$, such that

$$
\begin{equation*}
D_{\varepsilon} \leq\left|\int_{I} \ell_{n}(x, t) f_{0}(t) d t\right| \quad \text { for } \quad x \in M . \tag{3.49}
\end{equation*}
$$

Let $J_{1} \subset J, J_{2} \subset J$ be measurable sets such that

$$
\begin{cases}\left|\int_{I} \ell(x, t) f_{0}(t) d t\right|<\infty & \text { for } x \in J_{1},  \tag{3.50}\\ \left|\int_{I} \ell(x, t) f_{0}(t) d t\right|=\infty & \text { for } x \in J_{2} .\end{cases}
$$

If $\left|J_{2}\right|>0$, then

$$
\|L\| \geq \underset{x \in J_{2}}{\operatorname{ess} \sup }\left|\int_{I} \ell(x, t) f_{0}(t) d t\right|=\infty
$$

which is a contradiction. Thus, $\left|I \backslash J_{1}\right|=\left|J \backslash J_{1}\right|=0$, or

$$
\begin{equation*}
\int_{I}|\ell(x, t)|\left|f_{0}(t)\right| d t<\infty \quad \text { for a.e. } x \in J_{1} . \tag{3.51}
\end{equation*}
$$

Let $\delta>0$. Set $A_{\delta}=\left\{x \in J_{1} ; \sup _{|A|<\delta} \int_{A}|\ell(x, t)|\left|f_{0}(t)\right| d t<\varepsilon\right\}$. Observe that $A_{\delta_{2}} \subset A_{\delta_{1}}$ for $0<\delta_{1}<\delta_{2}$.

We will show now that $A_{\delta}$ is a measurable set. For $x \in J_{1}$ we define the function

$$
H_{\delta}(x)=\sup _{|A|<\delta} \int_{A}|\ell(x, t)|\left|f_{0}(t)\right| d t
$$

By (3.51), $H_{\delta}(x)<\infty$ for $x \in J_{1}$. Let $\mathcal{C}$ be a countable system of sets from Lemma 3.9. Let $\lambda>0$ and fix $x \in J_{1}$. By the definition of $H_{\delta}(x)$, there is a set $A_{0}$, such that $\left|A_{0}\right|<\delta$ and

$$
\begin{equation*}
H_{\delta}(x)-\lambda \leq \int_{A_{0}}|\ell(x, t)|\left|f_{0}(t)\right| d t \leq H_{\delta}(x) \tag{3.52}
\end{equation*}
$$

The absolute continuity of the Lebesgue integral and (3.51) now give the existence of $\eta>0$ such that

$$
\begin{equation*}
\int_{B}|\ell(x, t)|\left|f_{0}(t)\right| d t<\lambda \quad \text { for } \quad|B|<\eta \text {. } \tag{3.53}
\end{equation*}
$$

Obviously, we can choose $\eta<\delta$. Let $N_{0} \in \mathcal{C}$ such that $\left|A_{0} \div N_{0}\right|<\eta$. Then (3.52) and (3.53) yield

$$
\begin{aligned}
H_{\delta}(x) & \geq \sup _{N \in \mathcal{C}} \int_{N}|\ell(x, t)|\left|f_{0}(x)\right| d t \geq \int_{N_{0}}|\ell(x, t)|\left|f_{0}(t)\right| d t \\
& =\int_{A_{0}}|\ell(x, t)|\left|f_{0}(t)\right| d t-\int_{A_{0} \backslash N_{0}}|\ell(x, t)| \mid f_{0}(t) d t \\
& +\int_{N_{0} \backslash A_{0}}|\ell(x, t)|\left|f_{0}(t)\right| d t \geq H_{\delta}(x)-\lambda .
\end{aligned}
$$

On letting $\lambda \rightarrow 0_{+}$we have $H_{\delta}(x)=\sup _{N \in \mathcal{C}} \int_{N}|\ell(x, t)|\left|f_{0}(t)\right| d t$. Since the function $x \mapsto \int_{N}|\ell(x, t)|\left|f_{0}(t)\right| d t$ is measurable for any fixed $N \in \mathcal{C}$, the function $H_{\delta}$ is measurable as a supremum of countably many measurable functions. Moreover, as $A_{\delta}=H_{\delta}^{-1}((0, \varepsilon))$, the set $A_{\delta}$ is measurable for any $\delta>0$.

Now, the absolute continuity of the Lebesgue integral and (3.51) give $\bigcup_{\delta>0} A_{\delta}=$ $J_{1}$. Hence there is a $\delta_{0}$ such that $\left|A_{\delta_{0}} \cap M\right|>0$. By Lemma 3.6, there is a set $M_{1} \subset\left(A_{\delta_{0}} \cap M\right)$ with the following properties: $\left|\left(A_{\delta_{0}} \cap M\right) \backslash M_{1}\right|=0, M_{1}=\mathfrak{D}\left(M_{1}\right)$, and for any $x \in M_{1}$ there is a set $N_{\delta_{0}, x} \subset M_{1}$ such that $N_{\delta_{0}, x}=\mathfrak{D}\left(N_{\delta_{0}, x}\right), x \in N_{\delta_{0}, x}$ and $\left|B_{n, y} \div B_{n, z}\right|<\delta_{0}$ for $y, z \in N_{\delta_{0}, x}$. Let $x_{0} \in M_{1}$ be fixed. Then $N_{\delta_{0}, x_{0}}$ satisfies

$$
\begin{align*}
N_{\delta_{0}, x_{0}} & =\mathfrak{D}\left(N_{\delta_{0}, x_{0}}\right),  \tag{3.54}\\
x_{0} & \in N_{\delta_{0}, x_{0}}  \tag{3.55}\\
\mid B_{n, y} & \div B_{n, z} \mid<\delta_{0} \quad \text { for } \quad y, z \in N_{\delta_{0}, x_{0}} . \tag{3.56}
\end{align*}
$$

The properties (3.54) and (3.55) guarantee that $\left|N_{\delta_{0}, x_{0}}\right|>0$. Set $f_{1}(t)=$ $f_{0}(t) \chi_{B_{n, x_{0}}}(t)$. Clearly, $\left\|f_{1}\right\|_{X, v} \leq 1$. Fix $x \in N_{\delta_{0}, x_{0}}$. Note that (3.55) and (3.56) give

$$
\begin{equation*}
\left|B_{n, x_{0}} \div B_{n, x}\right|<\delta_{0} . \tag{3.57}
\end{equation*}
$$

Obviously,

$$
\begin{aligned}
& \int_{I} \ell(x, t) f_{1}(t) d t=\int_{B_{n, x_{0}}} \ell(x, t) f_{0}(t) d t \\
& \quad=\int_{B_{n, x_{0}} \cap B_{n, x}} \ell(x, t) f_{0}(t) d t+\int_{B_{n, x_{0} \backslash B_{n, x}} \ell(x, t) f_{0}(t) d t} \quad=\int_{I} \ell_{n}(x, t) f_{0}(t) d t-\int_{B_{n, x} \backslash B_{n, x_{0}}} \ell(x, t) f_{0}(t) d t+\int_{B_{n, x_{0} \backslash B_{n, x}}} \ell(x, t) f_{0}(t) d t .
\end{aligned}
$$

By (3.49), (3.57) and $N_{\delta_{0}, x_{0}} \subset A_{\delta_{0}}$, we have

$$
D_{\varepsilon}-2 \varepsilon \leq\left|\int_{I} \ell(x, t) f_{1}(t) d t\right| \quad \text { for any } x \in N_{\delta_{0}, x_{0}} .
$$

Since $\left|N_{\delta_{0}, x_{0}}\right|>0$, we have

$$
\|L\| \geq D_{\varepsilon}-2 \varepsilon
$$

If $\left\|L_{n}\right\|=\infty$, then $\|L\| \geq \frac{1}{\varepsilon}-2 \varepsilon$, which is a contradiction with (3.48). Thus, $\left\|L_{n}\right\|<\infty$ and $\|L\| \geq\left\|L_{n}\right\|-3 \varepsilon$. On letting $\varepsilon \rightarrow 0_{+}$we obtain (3.47).

Step 3. Denote $P_{n}=\operatorname{ess} \sup _{x \in I} F_{n}(x)$ for $n \in \mathbb{N}$, where $F_{n}(x)$ is defined by (3.46). Recall that $P=$ ess $\sup _{x \in \mathbb{N}} F(x)$. By Step $2, F_{n}$ and $F$ are measurable, and, consequently, $P$ and $P_{n}$ are well defined. We shall prove

$$
\begin{equation*}
\liminf _{n \rightarrow \infty} P_{n} \geq P \tag{3.58}
\end{equation*}
$$

Denote for $x \in J$ and $f \in(X, v)$

$$
F_{n}(x, f)=\left|\int_{I} \ell_{n}(x, t) f(t) d t\right| \quad \text { and } \quad F(x, f)=\left|\int_{I} \ell(x, t) f(t) d t\right| .
$$

Fix $x \in J$ and $f \in(X, v)$. Let

$$
I^{+}=\{t ; \ell(x, t) f(t)>0\}, \quad I^{-}=\{t ; \ell(x, t) f(t)<0\} .
$$

Obviously, the definition of $\ell_{n}$ gives

$$
\ell_{n}(x, t) f(t) \geq 0 \quad \text { on } I^{+}, \quad \ell_{n}(x, t) f(t) \leq 0 \quad \text { on } I^{-},
$$

and

$$
\begin{array}{lllll}
\ell_{n}(x, t) f(t) \nearrow \ell(x, t) f(t) & \text { a.e. in } & I^{+} & \text {for } & n \rightarrow \infty, \\
\ell_{n}(x, t) f(t) \searrow \ell(x, t) f(t) & \text { a.e. in } & I^{-} & \text {for } & n \rightarrow \infty .
\end{array}
$$

Of course, $\ell_{n}(x, t)=\ell(x, t)=0$ in $I \backslash\left(I^{+} \cup I^{-}\right)$. Then

$$
\begin{array}{ll}
\left(\ell_{n}(x, t) f(t)\right)^{+} \nearrow(\ell(x, t) f(t))^{+} & \text {for } n \rightarrow \infty \\
\left(\ell_{n}(x, t) f(t)\right)^{-} \nearrow(\ell(x, t) f(t))^{-} & \text {for } n \rightarrow \infty
\end{array}
$$

and, consequently,

$$
\int_{I} \ell_{n}(x, t) f(t) d t \rightarrow \int_{I} \ell(x, t) f(t) d t \quad \text { for } n \rightarrow \infty
$$

The last relation implies

$$
\begin{equation*}
F_{n}(x, f) \rightarrow F(x, f) \quad \text { for any } \quad x \in J \quad \text { and } \quad f \in(X, v) \tag{3.59}
\end{equation*}
$$

Let $\varepsilon>0$. Set $J_{1}=\left\{x ; F(x)<\infty, J_{2}=\left\{x ; F(x)=\infty\right.\right.$. Fix $x \in J_{1}$. By the definition of $F(x)$, there exists a function $f_{0},\left\|f_{0}\right\|_{X, v} \leq 1$, such that

$$
\begin{equation*}
F(x)-\varepsilon \leq F\left(x, f_{0}\right) \leq F(x) \tag{3.60}
\end{equation*}
$$

By (3.59), it is possible to choose $n_{0}$ such that for any $n \geq n_{0}$

$$
F\left(x, f_{0}\right)-\varepsilon \leq F_{n}\left(x, f_{0}\right) \leq F\left(x, f_{0}\right)+\varepsilon,
$$

which together with (3.60) gives

$$
F(x)-2 \varepsilon \leq F_{n}\left(x, f_{0}\right) \leq F(x)+\varepsilon,
$$

and, consequently,

$$
F(x)-2 \varepsilon \leq F_{n}\left(x, f_{0}\right) \leq \sup _{\|f\|_{X, v} \leq 1} F_{n}(x, f)=F_{n}(x)
$$

Thus, for any $\varepsilon>0$ there is an $n_{0}$ such that

$$
F(x)-2 \varepsilon \leq F_{n}(x) \quad \text { for } n \geq n_{0}
$$

which in turn yields

$$
\begin{equation*}
F(x) \leq \liminf _{n \rightarrow \infty} F_{n}(x) \quad \text { for any } \quad x \in J_{1} \tag{3.61}
\end{equation*}
$$

Fix $x \in J_{2}$. By the definition of $F(x)$ there exists a function $f_{0},\left\|f_{0}\right\|_{X, v} \leq 1$, such that $\frac{1}{\varepsilon} \leq F\left(x, f_{0}\right)$. By (3.59), we have $n_{0}$ such that for $n \geq n_{0}$,

$$
\frac{1}{\varepsilon}-\varepsilon \leq F_{n}\left(x, f_{0}\right) \leq \sup _{\|f\|_{X, v}} \leq 1=F_{n}(x, f)=F_{n}(x)
$$

It proves $\lim _{n \rightarrow \infty} F_{n}(x)=\infty$ and, consequently, (3.61) holds for $x \in J_{2}$.
Let $I_{n} \subset J,\left|J \backslash I_{n}\right|=0$ such that

$$
\begin{equation*}
P_{n}=\underset{x \in I}{\operatorname{ess} \sup } F_{n}(x)=\sup _{x \in I_{n}} F_{n}(x) \tag{3.62}
\end{equation*}
$$

Let $J_{3}=\bigcap_{n=1}^{\infty} I_{n}$. Clearly, $\left|J \backslash J_{3}\right|=0$. By (3.61) and (3.62),

$$
\begin{aligned}
P & \leq \operatorname{ess} \sup _{x \in I} \liminf _{n \rightarrow \infty} F_{n}(x) \leq \sup _{x \in J_{3}} \liminf _{n \rightarrow \infty} F_{n}(x) \\
& \leq \liminf _{n \rightarrow \infty} \sup _{x \in J_{3}} F_{n}(x) \leq \liminf _{n \rightarrow \infty} \sup _{x \in I_{n}} F_{n}(x) \\
& =\liminf _{n \rightarrow \infty} P_{n}
\end{aligned}
$$

which proves (3.58).
Step 4. We know from Step 1 that $\ell_{n} \in \mathcal{A}$. Moreover, $\left|\ell_{n}(x, t)\right| \leq n$ in $I^{2}$. Hence, $\ell_{n}$ satisfies the assumptions of Lemma 3.8, and thus $\left\|L_{n}\right\| \geq P_{n}$ for any $n \in \mathbb{N}$. Using (3.47) and (3.58), we get

$$
\|L\| \geq \limsup _{n \rightarrow \infty}\left\|L_{n}\right\| \geq \limsup _{n \rightarrow \infty} P_{n} \geq \liminf _{n \rightarrow \infty} P_{n} \geq P
$$

which completes the proof.
Remark 3.11. Let $\ell \in \mathcal{A}$ and let $\mathcal{F}$ be the unit ball of $(X, v)$. Then $P=\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$ where $\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$ is defined by (3.1).

Proof. Since $\ell \in \mathcal{A}$ we have that the function

$$
F(x)=\sup _{f \in F} \int_{I} \ell(x, t) f(t) d t
$$

is measurable. Clearly, using (2.6) and (2.7) we obtain

$$
F(x)=\sup _{f \in F}\left|\int_{I} \ell(x, t) f(t) d t\right|=\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}
$$

and thus

$$
P=\underset{x \in I}{\operatorname{ess} \sup } F(x)=\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)} .
$$

We have proved one part of Theorem 3.1. To completely verify Theorem 3.1 it remains to prove the following lemma.

Lemma 3.12. Let $\ell \in \mathcal{A}$. Then $\|L\| \leq\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$.
Proof. By Lemma 3.10 the function $x \mapsto\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}$ is measurable. The definition of $\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$ guarantees that there is a set $J,|I \backslash J|=0$, such that

$$
\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}=\sup _{x \in J}\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}
$$

For each $\|f\|_{X, v} \leq 1$ we obtain

$$
\begin{aligned}
\|L f\|_{\infty} & =\inf _{|M|=0} \sup _{x \in(I \backslash M)}\left|\int_{I} \ell(x, t) f(t) d t\right| \\
& \leq \sup _{x \in J}\left|\int_{I} \ell(x, t) f(t) d t\right| \leq \sup _{x \in J}\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}\|f\|_{X, v} \\
& \leq \sup _{x \in J}\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}=\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}
\end{aligned}
$$

which yields $\|L\| \leq\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$. The proof is complete.
We define $L_{\infty}\left(X^{\prime}, v\right)$ as the set of all $\ell \in \mathcal{A}$ such that

$$
\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}<\infty .
$$

Lemma 3.13. The set $L_{\infty}\left(X^{\prime}, v\right)$, equipped with the norm $\|\cdot\|_{L_{\infty}\left(X^{\prime}, v\right)}$, is a Banach space. Moreover, it satisfies
(i) $\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}=\||\ell|\|_{L_{\infty}\left(X^{\prime}, v\right)}$;
(ii) if $0 \leq \ell_{n} \nearrow \ell$ a.e. in $I^{2}$ and $\ell \in \mathcal{A}$, then $\left\|\ell_{n}\right\|_{L_{\infty}\left(X^{\prime}, v\right)} \nearrow\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$.

Proof. Clearly, $L_{\infty}\left(X^{\prime}, v\right)$ is a linear space, and $\|\cdot\|_{L_{\infty}\left(X^{\prime}, v\right)}$ defines a norm. The properties (i) is obvious. Let us prove (ii). By Lemma 2.3 it is $\ell_{n} \in \mathcal{A}$. Set $F_{n}(x)=$ $\left\|\frac{\ell_{n}(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}, F(x)=\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}$. Since $\left(X^{\prime}, v\right)$ and $L_{\infty}$ are Banach function spaces we have $F_{n}(x) \nearrow F(x)$ for a.e. $x \in I$ and, consequently, $\left\|F_{n}\right\|_{L_{\infty}} \nearrow\|F\|_{L_{\infty}}$, which proves (ii). Let us prove the completeness of $L_{\infty}\left(X^{\prime}, v\right)$. Let $\ell_{n}$ be a Cauchy sequence in $L_{\infty}\left(X^{\prime}, v\right)$. Take $J_{n, m} \subset I$ such that $\left|I \backslash J_{n, m}\right|=0$ and

$$
\left\|\ell_{n}-\ell_{m}\right\|_{L_{\infty}\left(X^{\prime}, v\right)}=\sup _{x \in J_{n, m}}\left\|\frac{\ell_{n}(x, \cdot)-\ell_{m}(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}
$$

Set

$$
\widetilde{J}=\bigcap_{n, m=1}^{\infty} J_{n, m} .
$$

Clearly, $|I \backslash \widetilde{J}|=0$.
Let $\varepsilon>0$. Since $\ell_{n}$ is a Cauchy sequence in $L_{\infty}\left(X^{\prime}, v\right)$ we have $n_{0}$ such that

$$
\begin{equation*}
\left\|\ell_{n}-\ell_{m}\right\|_{L_{\infty}\left(X^{\prime}, v\right)} \leq \sup _{x \in \widetilde{J}}\left\|\frac{\ell_{n}(x, \cdot)-\ell_{m}(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}<\varepsilon \text { for all } n, m>n_{0} \tag{3.63}
\end{equation*}
$$

Fix $x \in \widetilde{J}$. Then the sequence $\frac{\ell_{n}(x, \cdot)}{v(\cdot)}$ is a Cauchy sequence in $\left(X^{\prime}, v\right)$. Since $\left(X^{\prime}, v\right)$ is a Banach space there exists a unique function $\ell(x, \cdot)$ such that $\frac{\ell_{n}(x, \cdot)}{v(\cdot)} \rightarrow \frac{\ell(x, \cdot)}{v(\cdot)}$ in $\left(X^{\prime}, v\right)$. Thus, $\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}<\infty$ and

$$
\int_{I}|\ell(x, t) f(t)| d t \leq\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}\|f\|_{X, v}<\infty
$$

for each $f \in(X, v)$ which proves that $\int_{I}|\ell(x, t) f(t)| d t$ has a sense for all $f \in(X, v)$ and $x \in \widetilde{J}$. Consequently, $\ell \in \mathcal{A}$.

It remains to prove $\ell_{n} \rightarrow \ell$ in $L_{\infty}\left(X^{\prime}, v\right)$. Let $\varepsilon>0$ and $x \in \widetilde{J}$. Let $n_{0}$ satisfies (3.63). Since $\frac{\ell_{n}(x, \cdot)}{v(\cdot)} \rightarrow \frac{\ell(x, \cdot)}{v(\cdot)}$ in $\left(X^{\prime}, v\right)$ we can find $m>n_{0}$ such that $\left\|\frac{\ell_{m}(x, \cdot)-\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}<\varepsilon$. Then

$$
\left\|\frac{\ell_{n}(x, \cdot)-\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v} \leq\left\|\frac{\ell_{n}(x, \cdot)-\ell_{m}(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}+\left\|\frac{\ell_{m}(x, \cdot)-\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}<2 \varepsilon
$$

which gives for $n \rightarrow \infty$

$$
\underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{\ell_{n}(x, \cdot)-\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v} \leq \sup _{x \in \widetilde{J}}\left\|\frac{\ell_{n}(x, \cdot)-\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v} \rightarrow 0
$$

which finishes the proof.
It is a routine procedure to extend the result of Theorem 3.1 to an arbitrary interval $I=[a, b],-\infty<a<b<\infty$. This finishes the proof of Theorem 3.1.

## 4. Compactness of a general kernel operator

In this section we investigate the distance of the operator $L$ from the set of all compact operators $K:(X, v) \rightarrow L_{\infty}$. Define

$$
D=\inf \{\|L-K\| ; K \in \mathcal{K}\}
$$

where $\mathcal{K}$ is the set of all compact operators. Denote by $\mathfrak{R}$ the set of all kernels $k \in \mathfrak{M}\left(I^{2}\right)$ that can be written as

$$
k(x, t)=\sum_{i=1}^{n} \chi_{M_{i}}(x) \psi_{i}(t)
$$

for some $n \in \mathbb{N}, \chi_{M_{i}} \in \mathfrak{M}(I)$, and $\frac{\psi_{i}}{v} \in\left(X^{\prime}, v\right)$. Clearly, $k \in \mathfrak{R}$ implies $k \in$ $L_{\infty}\left(X^{\prime}, v\right)$. Let $\mathfrak{C}$ be the closure of $\mathfrak{R}$ in $L_{\infty}\left(X^{\prime}, v\right)$. Define further

$$
d:=\inf \left\{\|\ell-k\|_{L_{\infty}\left(X^{\prime}, v\right)} ; k \in \mathfrak{C}\right\}=\inf \left\{\|\ell-k\|_{L_{\infty}\left(X^{\prime}, v\right)} ; k \in \mathfrak{R}\right\} .
$$

Our main aim in this section is to prove that $D$ is comparable to $d$ and, consequently, that an operator $L$ is compact if and only if its kernel $\ell$ can be approximated in $L_{\infty}\left(X^{\prime}, v\right)$ by kernels from $\mathfrak{R}$.

Let $L$ be a fixed linear operator given by a kernel $\ell \in L_{\infty}\left(X^{\prime}, v\right)$.
Theorem 4.1. $\frac{d}{2} \leq D \leq d$.
The proof will be given in a series of lemmas.
Lemma 4.2. Let $k \in \mathfrak{R}$. Then the operator $(K f)(x)=\int_{I} k(x, t) f(t) d t$ is a finitedimensional bounded operator. Consequently, $K$ is compact.
Proof. Let $k(x, t)=\sum_{i=1}^{n} \chi_{M_{i}}(x) \psi_{i}(t), \chi_{M_{i}} \in \mathfrak{M}(I)$ and $\frac{\psi_{i}}{v} \in\left(X^{\prime}, v\right)$. Since $k \in L_{\infty}\left(X^{\prime}, v\right)$, the operator $K$ is bounded by Theorem 3.1. Moreover,

$$
K f(x)=\sum_{i=1}^{n} \int_{I} \psi_{i}(t) f(t) d t \chi_{M_{i}}(x)=\sum_{i=1}^{n} A_{i} \chi_{M_{i}}(x)
$$

Now, (2.6) gives $\left|A_{i}(f)\right| \leq\left\|\frac{\psi_{i}}{v}\right\|_{X^{\prime}, v}\|f\|_{X, v}$ which implies $A_{i} \in(X, v)^{*}$ (the dual space) and, consequently, $K$ is a bounded operator.

Now we are in a position to prove the second inequality in Theorem 4.1.
Lemma 4.3. $D \leq d$.
Proof. By Lemmas 3.12 and 4.2, we can write

$$
\begin{aligned}
D & \leq \inf _{k \in \mathfrak{R}} \sup _{\|f\|_{X, v} \leq 1} \operatorname{ess}_{x \in I} \sup _{x \in I}|\ell(x, t)-k(x, t) \| f(t)| d t \\
& \leq \inf _{k \in \mathfrak{R}} \sup _{\|f\|_{X, v}<1} \operatorname{ess} \sup _{x \in I}\left\|\frac{\ell(x, \cdot)-k(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}\|f\|_{X, v} \\
& =\inf _{k \in \mathfrak{R}}\|\ell-k\|_{L_{\infty}\left(X^{\prime}, v\right)}=d
\end{aligned}
$$

which proves the assertion.
In the rest of this section we show the first inequality in Theorem 4.1.
Definition 4.4. We say that a finite system of sets $\mathcal{A}=\left\{\Omega_{j} ; j=1,2, \ldots, n\right\}$ is a partition of $I$ if $\Omega_{i} \cap \Omega_{j}=\emptyset$ for $i \neq j$, and $\bigcup_{j=1}^{n} \Omega_{j}=I$.

Lemma 4.5. Let $n, N$ be positive integers. Let $\mathcal{A}_{i}=\left\{\Omega_{j}^{i} ; j=1,2, \ldots, N\right\}, i=$ $1,2, \ldots, n$ be partitions of $I$. Then there is a positive integer $m$ and a partition $\mathcal{A}=\left\{E_{k} ; k=1,2, \ldots, m\right\}$ of $I$ such that

$$
\begin{align*}
& \text { for any } \quad i \in\{1,2, \ldots, n\} \quad \text { and } k \in\{1,2, \ldots, m\} \quad \text { there exists }  \tag{4.1}\\
& a \quad j \in\{1,2, \ldots, N\} \quad \text { such that } E_{k} \subset \Omega_{j}^{i} .
\end{align*}
$$

Proof. We use the induction on $n$. Let $n=1$. Then the assertion is obvious.
Assume that $\mathcal{A}_{i}=\left\{\Omega_{j}^{i} ; j=1,2, \ldots, N\right\}, i=1,2, \ldots, n+1$, are partitions of $I$. By the induction assumption, there is a partition of $I, \widetilde{\mathcal{A}}=\left\{\widetilde{E}_{k} ; k=1,2, \ldots, \widetilde{m}\right\}$ such that
for any $i \in\{1,2, \ldots, n\} \quad$ and $\quad k \in\{1,2, \ldots, \tilde{m}\} \quad$ there exists
a $j \in\{1,2, \ldots, N\} \quad$ such that $\quad \tilde{E}_{k} \subset \Omega_{j}^{i}$.

Set $F_{k j}=\widetilde{E}_{k} \cap \Omega_{j}^{n+1}, k \in\{1,2, \ldots, \widetilde{m}\}$, and $j \in\{1,2, \ldots, N\}$. Define a system of sets $\mathcal{A}$ by

$$
\mathcal{A}=\left\{F_{k j} ; k \in\{1,2, \ldots, \widetilde{m}\} \text { and } j \in\{1,2, \ldots, N\}\right\}
$$

It is not difficult to verify that $\mathcal{A}$ is a partition of $I$ with the required properties.

Let $B$ be the unit ball in $(X, v)$. Let $M \subset L_{\infty}$ and $\eta>0$. We say that $N \subset L_{\infty}$ is a $\eta$-net in $M$ if for every $f \in M$ there is a $g \in N$ with $\|f-g\|_{L_{\infty}} \leq \eta$.

Lemma 4.6. Let

$$
\sigma=\inf \{\eta ; \text { there exists a finite } \eta-\text { net of } L(B)\}
$$

Then $\sigma \leq D$.
Proof. Let $\varepsilon>0$. Take $K \in \mathcal{K}$ such that

$$
\|L-K\| \leq D+\varepsilon
$$

Since $K \in \mathcal{K}$, there exists a finite $\varepsilon$-net $\left\{g_{1}, g_{2}, \ldots, g_{n}\right\}$ of $K(B)$. Let $g \in L(B)$. Then there is a function $f \in B$ such that $L f=g$. Choose $g_{i}$ with $\left\|K f-g_{i}\right\|_{L_{\infty}} \leq \varepsilon$. Then

$$
\left\|g-g_{i}\right\|_{L_{\infty}}=\left\|L f-g_{i}\right\|_{L_{\infty}} \leq\|L f-K f\|_{L_{\infty}}+\left\|K f-g_{i}\right\|_{L_{\infty}} \leq D+2 \varepsilon
$$

Thus, $\left\{g_{1}, \ldots, g_{n}\right\}$ is a finite $(D+2 \varepsilon)$-net of $L(B)$ and, consequently, $\sigma \leq D+2 \varepsilon$. On letting $\varepsilon \rightarrow 0_{+}$we obtain the assertion.

It is worth noting that Lemma 4.6 remains true under more general assumptions, namely, for Banach spaces $X, Y$, a bounded linear operator $T: X \rightarrow Y$, and $\sigma, D$ defined in an analogous way.

Lemma 4.7. Let $\lambda$ be a measure on $I$ such that $\lambda$-measurable sets coincide with the Lebesgue measurable sets, and $\lambda(E)=0$ if and only if $|E|=0$. Let $h(x, t) \in \mathfrak{M}\left(I^{2}\right)$, such that $h(x, t) v(t) \in \mathcal{A}$. Then the function $x \mapsto\|h(x, \cdot)\|_{X^{\prime}, v}$ is $\lambda$-measurable. Moreover, for $E \subset I$ measurable, $0<\lambda(E)<\infty$, we have

$$
\left\|\frac{1}{\lambda(E)} \int_{I} h(x, \cdot) d \lambda(x)\right\|_{X^{\prime}, v} \leq \frac{1}{\lambda(E)} \int_{I}\|h(x, \cdot)\|_{X^{\prime}, v} d \lambda(x) .
$$

Proof. Define $F(x)=\|h(x, \cdot)\|_{X^{\prime}, v}$. Clearly,

$$
F(x)=\sup _{\|f\|_{X, v} \leq 1} \int_{I}|h(x, t) f(t)| v(t) d t=\sup _{\|f\|_{X, v} \leq 1}\left|\int_{I} h(x, t) f(t) v(t) d t\right| .
$$

By Theorem 3.1, the last expression is a Lebesgue measurable function, whence $F$ is Lebesgue measurable. Due to the assumptions on $\lambda, F$ is $\lambda$-measurable, which proves the first part of the lemma.

Now, using the Fubini theorem, we have

$$
\left\|\frac{1}{\lambda(E)} \int_{I} h(x, \cdot) d \lambda(x)\right\|_{X^{\prime}, v}=\frac{1}{\lambda(E)} \sup _{\|f\|_{X, v} \leq 1}\left|\int_{I} \int_{I} h(x, t) f(t) v(t) d t d \lambda(x)\right|=A,
$$

say. Assume that $A<\infty$ (the case $A+\infty$ can be handled analogously). Let $\varepsilon>0$. Then there is an $f_{0} \in B$ such that

$$
\begin{aligned}
A-\varepsilon & \leq \frac{1}{\lambda(E)}\left|\int_{I} \int_{I} h(x, t) f_{0}(t) v(t) d t d \lambda(x)\right| \\
& \leq \frac{1}{\lambda(E)} \int_{I} F(x) d \lambda(x)=\frac{1}{\lambda(E)} \int_{I}\|h(x, \cdot)\|_{X^{\prime}, v} d \lambda(x)
\end{aligned}
$$

On letting $\varepsilon \rightarrow 0_{+}$we obtain the assertion.
The main idea of the proof of the following lemma is taken from [10].
Lemma 4.8. The inequality $\frac{d}{2} \leq \sigma$ holds.
Proof. Let $\varepsilon>0$. Let $\left\{g_{1}, g_{2}, \ldots, g_{n}\right\}$ be a finite $(\sigma+\varepsilon)$-net of $L(B)$. Since $L(B)$ is bounded in $L_{\infty}$, the set $\left\{g_{1}, g_{2}, \ldots, g_{n}\right\}$ is bounded in $L_{\infty}$, too. Hence there exists an $A>0$ such that ess $\sup _{x \in I}\left|g_{i}(x)\right| \leq A, \quad i=1,2, \ldots, n$. We can even assume that $\sup _{x \in I}\left|g_{i}(x)\right| \leq A$ because in the opposite case we simply change every function $g_{i}$ on a set of measure zero.

Let $\left\{I_{j} ; j=1,2, \ldots, N\right\}$ be a partition of $[-A, A]$ such that $I_{j}$ are intervals and $\left|I_{j}\right| \leq \varepsilon$. Let $\Omega_{j}^{i}=g_{i}^{-1}\left(I_{j}\right), i=1,2, \ldots, n, j=1,2, \ldots, N$. Then the systems $\mathcal{A}_{i}=\left\{\Omega_{j}^{i} ; j=1,2, \ldots, N\right\}$ are partitions of $I$. By Lemma 3.5 , there is a partition of $I$, say, $\mathcal{A}=\left\{E_{k} ; k=1,2, \ldots, m\right\}$, such that (4.1) holds.

Let $B=\left\{E_{k} \in \mathcal{A} ;\left|E_{k}\right|>0\right\}$. Then we can write $B=\left\{E_{k} ; k=1,2, \ldots, m_{1}\right\}$ where $m_{1} \leq m$. Clearly,

$$
\begin{equation*}
E_{k_{1}} \cap E_{k_{2}}=\emptyset, \quad k_{1}, k_{2} \in\left\{1, \ldots, m_{1}\right\}, \quad k_{1} \neq k_{2} \tag{4.2}
\end{equation*}
$$

$$
\begin{equation*}
\left|I \backslash \bigcup_{k=1}^{m_{1}} E_{k}\right|=0 \tag{4.3}
\end{equation*}
$$

and

$$
\begin{equation*}
\text { for every } \quad i \in\{1,2, \ldots, n\} \quad \text { and } \quad k \in\left\{1,2, \ldots, m_{1}\right\} \quad \text { there is } \tag{4.4}
\end{equation*}
$$

$$
\begin{equation*}
\text { a } j \in\{1,2, \ldots, N\} \quad \text { such that } \quad E_{k} \subset \Omega_{j}^{i} . \tag{4.5}
\end{equation*}
$$

We define the operator

$$
\left(P_{\varepsilon} f\right)(x)=\sum_{k=1}^{m_{1}} \chi_{E_{k}}(x) \frac{\int_{E_{k}} f(t) e^{-t^{2}} d t}{\int_{E_{k}} e^{-t^{2}} d t}
$$

Then $\left(P_{\varepsilon} f\right)(x)$ is defined on $\bigcup_{k=1}^{m_{1}} E_{k}$ and therefore, by (4.3), it is defined a.e. on $I$. It is not difficult to see that $P_{\varepsilon}: L_{\infty} \rightarrow L_{\infty}$ is a bounded linear finite-dimensional operator. Moreover, using (4.2), we obtain

$$
\begin{aligned}
\left(P_{\varepsilon}^{2} f\right)(x) & =\sum_{k=1}^{m_{1}} \chi_{E_{k}}(x) \frac{1}{\int_{E_{k}} e^{-t^{2}} d t} \int_{E_{k}}\left(P_{\varepsilon} f\right)(t) e^{-t^{2}} d t \\
& =\sum_{k=1}^{m_{1}} \frac{\chi_{E_{k}}(x)}{\int_{E_{k}} e^{-t^{2}} d t} \int_{E_{k}} \sum_{\ell=1}^{m_{1}} \chi_{E_{\ell}}(t) \frac{\int_{E_{\ell}} f(s) e^{-s^{2}} d s}{\int_{E_{\ell}} e^{-s^{2}} d s} e^{-t^{2}} d t \\
& =\sum_{k=1}^{m_{1}} \chi_{E_{k}}(x) \frac{\int_{E_{k}} f(s) e^{-s^{2}} d s}{\int_{E_{k}} e^{-s^{2}} d s}=\left(P_{\varepsilon} f\right)(x),
\end{aligned}
$$

which proves

$$
P_{\varepsilon}^{2}=P_{\varepsilon}
$$

In other words, $P_{\varepsilon}$ is a projection. Further, due to (4.2),

$$
\left\|P_{\varepsilon} f\right\|_{L_{\infty}} \leq\|f\|_{L_{\infty}} \underset{x \in I}{\operatorname{ess} \sup } \sum_{k=1}^{m_{1}} \chi_{E_{k}}(x)=\|f\|_{L_{\infty}}
$$

which gives

$$
\begin{equation*}
\left\|P_{\varepsilon}\right\| \leq 1 \tag{4.6}
\end{equation*}
$$

Let $Z$ be the finite-dimensional subspace of $L_{\infty}$ defined by

$$
Z=\left\{f=\sum_{k=1}^{m_{1}} a_{k} \chi_{E_{k}}(x) ;\left(a_{1}, \ldots, a_{m_{1}}\right) \in \mathbb{R}^{m_{1}}\right\}
$$

In fact, $P_{\varepsilon}: L_{\infty} \rightarrow Z$. Moreover, let $f=\sum_{k=1}^{m_{1}} a_{k} \chi_{E_{k}}(x) \in Z$. Then, by (4.2), we can write

$$
\begin{aligned}
\left(P_{\varepsilon} f\right)(x) & =\sum_{k=1}^{m_{1}} \chi_{E_{k}}(x) \frac{1}{\int_{E_{k}} e^{-t^{2}} d t} \int_{E_{k}} a_{k} e^{-t^{2}} d t \\
& =\sum_{k=1}^{m_{1}} a_{k} \chi_{E_{k}}(x)=f(x)
\end{aligned}
$$

which shows that

$$
\begin{equation*}
P_{\varepsilon} f=f \quad \text { for any } \quad f \in Z \tag{4.7}
\end{equation*}
$$

We claim that dist $\left(g_{i}, Z\right) \leq \varepsilon$ for any $i \in\{1,2, \ldots, n\}$. Fix $i \in\{1,2, \ldots, n\}$. By (4.4), for every $k \in\left\{1,2, \ldots, m_{1}\right\}$ there is a set $\Omega_{j_{k}}^{i}$ such that $E_{k} \subset \Omega_{j_{k}}^{i}$. Consequently, $g_{i}\left(E_{k}\right) \subset I_{j_{k}}$. Choose $\gamma_{k} \in I_{j_{k}}, k=1,2, \ldots, m_{1}$ and define the function $\bar{g}_{i}$ by

$$
\bar{g}_{i}(x)=\sum_{k=1}^{m_{1}} \gamma_{k} \chi_{E_{k}}(x) .
$$

Then $\bar{g}_{i} \in Z$ and, moreover, $\left|I_{j_{k}}\right| \leq \varepsilon$ implies that

$$
\begin{equation*}
\left\|g_{i}-\bar{g}_{i}\right\|_{L_{\infty}}=\sup _{k \in\left\{1,2, \ldots, m_{1}\right\}} \operatorname{ess}_{x \in E_{k}}^{\sup }\left|g_{i}(x)-\gamma_{k}\right| \leq \varepsilon \tag{4.8}
\end{equation*}
$$

Let $f \in B$. We shall estimate $\left\|L f-P_{\varepsilon} L f\right\|_{L_{\infty}}$. Choose $g_{i}$ such that $\left\|L f-g_{i}\right\|_{L_{\infty}} \leq$ $\sigma+\varepsilon$. Then

$$
\begin{aligned}
\left\|L f-P_{\varepsilon} L f\right\|_{L_{\infty}} & \leq\left\|L f-g_{i}\right\|_{L_{\infty}}+\left\|P_{\varepsilon}\left(L f-g_{i}\right)\right\|_{L_{\infty}}+\left\|g_{i}-\bar{g}_{i}\right\|_{L_{\infty}}+\left\|\bar{g}_{i}-P_{\varepsilon} g_{i}\right\|_{L_{\infty}} \\
& \leq \sigma+\varepsilon+\left\|P_{\varepsilon}\right\|(\sigma+\varepsilon)+\left\|g_{i}-\bar{g}_{i}\right\|_{L_{\infty}}+\left\|\bar{g}_{i}-P_{\varepsilon} g_{i}\right\|_{L_{\infty}} .
\end{aligned}
$$

Using (4.6)-(4.8) and $\bar{g}_{i}=P \bar{g}_{i}$, we get

$$
\left\|L f-P_{\varepsilon} L f\right\|_{L_{\infty}} \leq 2 \sigma+3 \varepsilon+\left\|P_{\varepsilon}\left(\bar{g}_{i}-g_{i}\right)\right\|_{L_{\infty}} \leq 2 \sigma+4 \varepsilon
$$

that is,

$$
\begin{equation*}
\left\|L-P_{\varepsilon} L\right\| \leq 2 \sigma+4 \varepsilon \tag{4.9}
\end{equation*}
$$

Now let us deal with $\left(P_{\varepsilon} L f\right)(x)$. Clearly,

$$
\begin{aligned}
\left(P_{\varepsilon} L f\right)(x) & =\sum_{j=1}^{m_{1}} \chi_{E_{j}}(x) \frac{\int_{E_{j}}(L f)(t) e^{-t^{2}} d t}{\int_{E_{j}} e^{-t^{2}} d t} \\
& =\sum_{j=1}^{m_{1}} \chi_{E_{j}}(x) \frac{1}{\int_{E_{j}} e^{-t^{2}} d t} \int_{E_{j}} \int_{I} \ell(t, s) f(s) d s e^{-t^{2}} d t \\
& =\int_{I}\left(\sum_{j=1}^{m_{1}} \chi_{E_{j}}(x) \frac{\int_{E_{j}} \ell(t, s) e^{-t^{2}} d t}{\int_{E_{j}} e^{-t^{2}} d t}\right) f(s) d s \\
& =\int_{I} k_{\varepsilon}(x, s) f(s) d s
\end{aligned}
$$

where

$$
\begin{equation*}
k_{\varepsilon}(x, s)=\sum_{j=1}^{m_{1}} \chi_{E_{j}}(x) \frac{\int_{E_{j}} \ell(t, s) e^{-t^{2}} d t}{\int_{E_{j}} e^{-t^{2}} d t}=\sum_{j=1}^{m_{1}} \chi_{E_{j}}(x) \psi_{j}(t) \quad \text { say. } \tag{4.10}
\end{equation*}
$$

Thus, $P_{\varepsilon} L$ is a kernel operator with the kernel $k_{\varepsilon}(x, s)$. Now, $\ell \in \mathfrak{M}\left(I^{2}\right)$ implies $\psi_{j}(s) \in \mathfrak{M}(I)$, and, consequently, $k_{\varepsilon} \in \mathfrak{M}\left(I^{2}\right)$.

Define the measure $\lambda$ on $I$ by $\lambda(E)=\int_{E} e^{-t^{2}} d t$. It is not difficult to prove that $\lambda$ satisfies the assumptions of Lemma 4.7. Moreover, we have $0<\lambda\left(E_{j}\right) \leq \lambda(I)=$ $\int_{I} e^{-t^{2}} d t \leq \int_{-\infty}^{\infty} e^{-t^{2}} d t<\infty$ for any $j \in\left\{1,2, \ldots, m_{1}\right\}$. Setting $h(x, t)=\frac{\ell(x, t)}{v(t)}$, we have $h(x, t) v(t) \in \mathcal{A}$, and, using also Lemma 4.7, we can write

$$
\begin{aligned}
\left\|\frac{\psi_{j}(s)}{v(s)}\right\|_{X^{\prime}, v} & =\left\|\int_{E_{j}} \frac{\ell(t, s) e^{-t^{2}}}{v(s) \int_{E_{j}} e^{-t^{2}} d t} d t\right\|_{X^{\prime}, v}=\left\|\frac{1}{\lambda\left(E_{j}\right)} \int_{E_{j}} h(t, \cdot) d \lambda(t)\right\|_{X^{\prime}, v} \\
& \leq \frac{1}{\lambda\left(E_{j}\right)} \int_{E_{j}}\|h(t, \cdot)\|_{X^{\prime}, v} d \lambda(t)=\frac{1}{\lambda\left(E_{j}\right)} \int_{E_{j}}\left\|\frac{\ell(t, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v} d \lambda(t) \\
& \leq \underset{x \in E_{j}}{\operatorname{ess} \sup }\left\|\frac{\ell(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v} \leq\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}
\end{aligned}
$$

which gives

$$
\begin{equation*}
\left\|\frac{\psi_{j}}{v}\right\| \leq\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)} \tag{4.11}
\end{equation*}
$$

This implies

$$
\begin{aligned}
\left\|\ell-k_{\varepsilon}\right\|_{L_{\infty}\left(X^{\prime}, v\right)} & \leq\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}+\left\|\sum_{j=1}^{m_{1}} \chi_{E_{j}}(x) \psi_{j}(s)\right\|_{L_{\infty}\left(X^{\prime}, v\right)} \\
& \leq\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}+\sum_{j=1}^{m_{1}}\left\|\chi_{E_{j}}\right\|_{L_{\infty}}\left\|\frac{\psi_{j}}{v}\right\|_{X^{\prime}, v}
\end{aligned}
$$

From (4.11) we obtain $\left\|\ell-k_{\varepsilon}\right\|_{L_{\infty}\left(X^{\prime}, v\right)} \leq\left(1+m_{1}\right)\|\ell\|_{L_{\infty}\left(X^{\prime}, v\right)}$ and, consequently, using also Lemma 3.12, we have $\ell-k_{\varepsilon} \in \mathcal{A}$. Now, Theorem 3.1 yields

$$
\left\|\ell-k_{\varepsilon}\right\|_{L_{\infty}\left(X^{\prime}, v\right)}=\left\|L-P_{\varepsilon} L\right\| .
$$

Together with (4.9) this implies

$$
\left\|\ell-k_{\varepsilon}\right\| \leq 2 \sigma+4 \varepsilon
$$

By (4.10) and (4.11), $k_{\varepsilon} \in \mathfrak{R}$ and, consequently,

$$
d=\inf _{k \in \mathfrak{R}}\|\ell-k\|_{L_{\infty}\left(X^{\prime}, v\right)} \leq\left\|\ell-k_{\varepsilon}\right\|_{\left(X^{\prime}, v\right)} \leq 2 \sigma+4 \varepsilon .
$$

On letting $\varepsilon \rightarrow 0_{+}$we obtain $d \leq 2 \sigma$, and the proof is complete.
The first inequality in Theorem 4.1 now follows from Lemmas 4.5 and 4.7.

## 5. Application to the Hardy operator

Let $I=[a, b],-\infty \leq a<b \leq+\infty$. We define the Hardy operator by $\operatorname{Hf}(x)=$ $\int_{a}^{x} f(t) d t$. Further, let

$$
U(x, \varepsilon)=\left\{\begin{array}{l}
(x-\varepsilon, x+\varepsilon) \cap[a, b] \quad \text { if } \quad-\infty<x<\infty \\
\left(-\infty,-\frac{1}{\varepsilon}\right) \cap[a, b] \quad \text { if } \quad x=-\infty \\
\left(\frac{1}{\varepsilon}, \infty\right) \cap[a, b] \quad \text { if } \quad x=\infty .
\end{array}\right.
$$

We also denote

$$
B(x)=\lim _{\varepsilon \rightarrow 0_{+}}\left\|\chi_{U(x, \varepsilon)} \frac{1}{v}\right\|_{X^{\prime}, v}, \quad \text { and } \quad B=\sup _{a \leq x \leq b} B(x) .
$$

In [5], a characterization of the boundedness and compactness of the Hardy operator was characterized for $I=[0, \infty]$. It was shown that $H$ is bounded if and only if $\frac{1}{v} \in\left(X^{\prime}, v\right)$, and that $H$ is compact if and only if $B=0$. We will apply the results of Sections 3 and 4 to the Hardy operator and $I=[a, b]$. Observe that the Hardy operator is given by the kernel $h(x, t)=\chi_{(a, x)}(t)$, i.e. $\int_{a}^{x} f(t) d t=$ $\int_{I} \chi_{(a, x)}(t) f(t) d t$.

Theorem 5.1. The operator $H$ is bounded from $(X, v)$ into $L_{\infty}$ if and only if $\left\|\frac{1}{v}\right\|_{X^{\prime}, v}<\infty$.

Proof. By Theorem 3.1, $H$ is bounded if and only if $\|h\|_{L_{\infty}\left(X^{\prime}, v\right)}<\infty$. Moreover, $\|H\|=\|h\|_{L_{\infty}\left(X^{\prime}, v\right)}$. Then

$$
\|H\|=\underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{h(x, \cdot)}{v(\cdot)}\right\|_{X^{\prime}, v}=\underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{\chi_{(a, x)}(t)}{v(t)}\right\|_{X^{\prime}, v}=\left\|\frac{1}{v}\right\|_{X^{\prime}, v},
$$

which completes the proof.
Lemma 5.2. The inequality $d \leq B$ holds.
Proof. Let $\varepsilon>0$. From the definition of $B$ we know that for every $x \in[a, b]$ there is an $\eta(x)>0$ such that

$$
\left\|\chi_{U(x, \eta(x))}(t) \frac{1}{v(t)}\right\|_{X^{\prime}, v} \leq B+\varepsilon .
$$

Since $\bigcup_{x \in I} U(x, \eta(x)) \supset I$ and $I=[a, b]$ is a compact set in the topology induced by $U(x, \varepsilon)$, we can choose $x_{1}, \ldots, x_{n} \in I$ such that $\bigcup_{i=1}^{n} U\left(x_{i}, \eta\left(x_{i}\right)\right) \supset I$. Denote $\widetilde{U}_{i}=U\left(x_{i}, \eta\left(x_{i}\right)\right)$. Take $\alpha_{i}, \beta_{i}, i=1,2, \ldots, n$, such that

$$
\begin{equation*}
U_{i}:=\left(\alpha_{i}, \beta_{i}\right) \subset \widetilde{U}_{i}, \quad i=1,2, \ldots, n, \tag{5.1}
\end{equation*}
$$

and

$$
\begin{equation*}
\sum_{i=1} n \chi_{U_{i}}(x)=1 \quad \text { a.e. in } I . \tag{5.2}
\end{equation*}
$$

Let us define $k(x, t)=\sum_{i=1}^{n} \chi_{U_{i}}(x) \chi_{\left(a, \alpha_{i}\right)}(t)$. Clearly, by (5.1) and (5.2), we have

$$
\begin{aligned}
d & \leq \underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{1}{v(t)} \sum_{i=1}^{n} \chi_{U_{i}}(x)\left(\chi_{(a, x)}(t)-\chi_{\left(a, \alpha_{i}\right)}(t)\right)\right\|_{X^{\prime}, v} \\
& =\underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{1}{v(t)} \sum_{i=1}^{n} \chi_{U_{i}}(x) \chi_{\left(\alpha_{i}, x\right)}(t)\right\|_{X^{\prime}, v} \\
& \leq \underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{1}{v(t)} \sum_{i=1}^{n} \chi_{U_{i}}(x) \chi_{U_{i}}(t)\right\|_{X^{\prime}, v} \\
& \leq \underset{x \in I}{\operatorname{ess} \sup } \sum_{i=1}^{n} \chi_{U_{i}}(x)\left\|\frac{\chi_{U_{i}}(t)}{v(t)}\right\|_{X^{\prime}, v} \leq B+\varepsilon
\end{aligned}
$$

Therefore, $d \leq B+\varepsilon$ for any $\varepsilon>0$, and the assertion follows.
Lemma 5.3. The inequality $B \leq 4 d$ holds.
Proof. Let $\varepsilon>0$. Then, for some $M_{i}$ and $\psi_{i}, i=1, \ldots, n$,

$$
\begin{equation*}
\left\|\chi_{(a, x)}(t)-\sum_{i=1}^{n} \chi_{M_{i}}(x) \psi_{i}(t)\right\|_{L_{\infty}\left(X^{\prime}, v\right)} \leq d+\varepsilon \tag{5.3}
\end{equation*}
$$

Let $x_{0} \in[a, b)$. Then there is a $k \in\{1,2, \ldots, n\}$ such that $\left|\left(x_{0}, x_{0}+\sigma\right) \cap M_{k}\right|>0$ for any $\sigma>0$. Set $x_{1}=$ ess $\sup M_{k}$, i.e., $x_{1}=\inf \left\{y ;\left|(y, b) \cap M_{k}\right|=0\right\}$. Let $N_{k}=M_{k} \cap\left(x_{0}, x_{1}\right)$. Then (5.3) gives

$$
\begin{aligned}
d+\varepsilon & \geq \underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{1}{v(t)}\left(\chi_{(a, x)}(t)-\sum_{i=1}^{n} \chi_{M_{i}}(x) \psi_{i}(t)\right) \chi_{N_{k}}(x) \chi_{\left(x_{0}, x_{1}\right)}(t)\right\|_{X^{\prime}, v} \\
& =\underset{x \in I}{\operatorname{ess} \sup }\left\|\frac{1}{v(t)}\left(\chi_{\left(x_{0}, x\right)}(t)-\chi_{\left(x_{0}, x_{1}\right)}(t) \psi_{k}(t)\right) \chi_{N_{k}}(x)\right\|_{X^{\prime}, v} \\
& =\underset{x \in N_{k}}{\operatorname{ess} \sup } \| \frac{1}{v(t)}\left(\chi_{\left(x_{0}, x\right)}(t)\left(1-\psi_{k}(t)\right)-\chi_{\left(x, x_{1}\right)}(t) \psi_{k}(t) \|_{X^{\prime}, v}\right.
\end{aligned}
$$

Since $\left(x_{0}, x\right) \cap\left(x, x_{1}\right)=\emptyset$ for every $x \in N_{k}$, we have

$$
\begin{aligned}
d+\varepsilon & \geq \underset{x \in N_{k}}{\operatorname{ess} \sup }\left\|\frac{1}{v(t)} \chi_{\left(x_{0}, x\right)}(t)\left(1-\psi_{k}(t)\right)\right\|_{X^{\prime}, v} \\
& =\left\|\frac{1}{v(t)} \chi_{\left(x_{0}, x_{1}\right)}(t)\left(1-\psi_{k}(t)\right)\right\|_{X^{\prime}, v}
\end{aligned}
$$

and

$$
d+\varepsilon \geq \underset{x \in N_{k}}{\operatorname{ess} \sup }\left\|\frac{1}{v(t)} \chi_{\left(x, x_{1}\right)}(t) \psi_{k}(t)\right\|_{X^{\prime}, v}=\left\|\frac{1}{v(t)} \chi_{\left(x_{0}, x_{1}\right)}(t) \psi_{k}(t)\right\|_{X^{\prime}, v}
$$

As a consequence we obtain

$$
\begin{align*}
\left\|\frac{\chi_{\left(x_{0}, x_{1}\right)}(t)}{v(t)}\right\|_{X^{\prime}, v} \leq & \left\|\chi_{\left(x_{0}, x_{1}\right)}(t) \frac{1-\psi_{k}(t)}{v(t)}\right\|_{X^{\prime}, v}  \tag{5.4}\\
& +\left\|\chi_{\left(x_{0}, x_{1}\right)}(t) \frac{\psi_{k}(t)}{v(t)}\right\|_{X^{\prime}, v} \leq 2 d+2 \varepsilon \tag{5.5}
\end{align*}
$$

Let $B^{+}(x)=\lim _{\varepsilon \rightarrow 0_{+}}\left\|\frac{\chi_{(x, x+\varepsilon)}(t)}{v(t)}\right\|_{X^{\prime}, v}$ for $x \in[a, b)$ and, analogously, $B^{-}(x)=$ $\lim _{\varepsilon \rightarrow 0_{+}}\left\|\frac{\chi_{(x-\varepsilon, x)}(x)}{v(t)}\right\|_{X^{\prime}, v}$ for $x \in(a, b]$. Then $B(a)=B^{+}(a), B(b)=B^{-}(b)$ and $B(x) \leq B^{+}(x)+B^{-}(x)$ for $x \in(a, b)$ which together with (5.4) yields

$$
B\left(x_{0}\right) \leq B^{+}\left(x_{0}\right)+B^{-}\left(x_{0}\right) \leq 4 d+4 \varepsilon .
$$

Letting $\varepsilon \rightarrow 0_{+}$, we obtain $B\left(x_{0}\right) \leq 4 d$ and, consequently, $B \leq 4 d$, which completes the proof.

Corollary 5.4. The inequalities $\frac{B}{8} \leq D \leq B$ hold. The Hardy operator is compact if and only if $B=0$.
